

## Mathematics 2200H – Mathematical Reasoning

TRENT UNIVERSITY, Fall 2022

### Extra Assignment #41

#### To Bee or not to Bee

*Due on Monday, 31 October.\**

Bhaskara II (1114-1185), also known as Bhaskaracharya (“Bhaskara the Teacher”), was an Indian mathematician and astronomer who continued the Indian tradition of writing mathematics in verse. Here are two problems from his book on arithmetic, *Lilavati*, which was named after and dedicated to his daughter. “Lilavati” apparently means “playful”, and a number of the problems in the book fit the title. Here are two such problems from *Lilavati*, taken from the prose translation by Henry Colebrooke [1].

54. *Out of a swarm of bees, one-fifth part settled on a blossom of Columba; and one-third on a flower of Silínd’hrí; three times the difference of those numbers flew to the bloom of a Cutája. One bee, which remained, hovered and flew about in the air, allured at the same moment by the pleasing fragrance of a jasmin and pandanus. Tell me, charming woman, the number of bees.*

68. *The square-root of half the number of a swarm of bees is gone to the shrub of jasmin; and so are eight-ninths of the whole swarm; a female is buzzing to one remaining male that is humming within a lotus, in which ihe is confined, having been allured to its fragrance at night. Say, lovely woman, the number of bees.*

1. Solve problem 54, given above. [5]
2. Solve problem 68, given above. [5]

For full credit, please write up your solutions as poems.

#### REFERENCE

1. *Algebra, with Arithmetic and mensuration, from the Sanscrit of Brahmagupta and Bhàscara*, Henry Thomas Colebrooke, 1817. Online at: <https://archive.org/stream/algebrawitharith00brahuoft#mode/2up> [Accessed 2022-10-20.]
