

**Mathematics 3260H – Geometry II: Projective and Non-Euclidean Geometry**

TRENT UNIVERSITY, Fall 2021

**Assignment #5**

**Not an affine plane ...**

*Due on Friday, 15 October.*

*May be submitted on paper or via Blackboard.\**

This assignment is a follow-up of sorts to Assignment #4.

$\mathbb{Z}_4$  is the algebraic structure (it's a ring, if you want to be technical) of the integers mod 4. That is,  $\mathbb{Z}_4$  has four elements, 0, 1, 2, and 3, and the operations of  $+$  and  $\cdot$  “roll over” when they reach 4 like a clock with four hours. (Thus  $4 = 0 \pmod{4}$ ,  $5 = 1 \pmod{4}$ , and so on.) To be completely explicit, the operations of  $+$  and  $\cdot$  in  $\mathbb{Z}_4$  are given by the following tables:

$+$	0	1	2	3	$\cdot$	0	1	2	3
0	0	1	2	3	0	0	0	0	0
1	1	2	3	0	1	0	1	2	3
2	2	3	0	1	2	0	2	0	2
3	3	0	1	2	3	0	3	2	1

We can use  $\mathbb{Z}_4$  as the basis for a two-dimensional system of Cartesian-style coordinates, denoting the resulting geometry by  $\mathbb{Z}_4^2$ . Points are given by their coordinates and lines are given by equations of the form  $x = a$  and  $y = mx + b$ . (Of course, we are restricted to using the elements and operations of  $\mathbb{Z}_4$ .) This gives a geometry that isn't an affine plane, as you will show.

1. Draw the “plane”  $\mathbb{Z}_4^2$ . [5]
2. Explain why  $\mathbb{Z}_4^2$  is not an affine plane. List as many reasons why it isn't as you can find. [5]

---
