

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

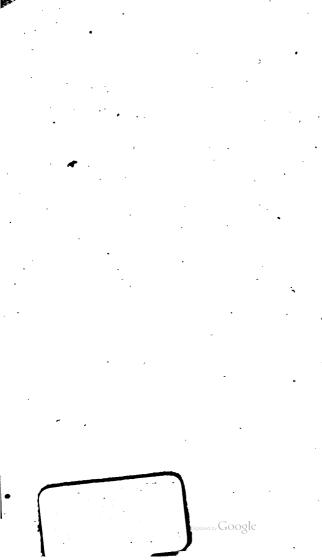

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + Keep it legal Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. To

To the READER.

Courtews Reader,

Having the Happiness of an Intimate Acquaintance with Mr. Cocker in his Lifesime, often follcited him to remember his Promife to the World, of Publishing his Arithmerick, but (for Reasons belt known to himself) he refuled it ; and (after his Death) the Copy falling accidentally into my Hands, I thought it not convenient to fmother a Work of fo confiderable a moment, not questioning but it might be as kindly accepted as if it had been prelented by his own Hand. The Method is familiar and easie, discovering as well the Theorick as the Practice of that Necessary Art of Vulgar Arithmetick : And in this new Edition there are many remarkable Alterations for the benefit of the Teacher or Learner, which I hope will be very acceptable to the World : I have also performed my promile in Publishing the Decimal Arithmetick, which finds Encouragement to my Expectation, and the Bookfellers too, I am,

Thine to serve thee,

John Hawkins.

Mr.

Mr. Edward Cocker's

PROEME or PREFACE.

B? the facred Influence of Divine Providence, I have been Infrumental to the benefit of many; by vertue of those useful Arts, Writing and Engraving: And do now with the fame wonted atacrity cast this my Arithmetical Mite into the Publick Treasury, befeeching the Almighty to grant the like Blefsing to these as to my former Labours.

Seven Sciences supremely excellent, Are the chief Stars in Wisdoms Firmament, Whereof Arithmetick is one, whose worth The Beams of Profit and Delight spines forth; Tois crowns the rest; this makes Man's Mind complete; This treats of Numbers, and of this we treat.

I have been often defired by my internate-Friends to publifs fomething on this Subject, who is a pleafing Freedom have fignified to me that they expected it would be extraordinary. How far I have answered their Expectation, I know not; but this I throw; that I have do figned this Work not extraordinary abstruct or profound,

The Proeme or Preface.

profound, but have by all means possible michin the Circumference of my Capacity, endeavoured to render it extraordinary useful to all those, whose Occasions shall induce them to make use of Number, 'If it be objected that the Books already published, treating of Numbers, are innumerable; I Answer, that's but a small Wonder, fince the Art is infinite. But that there should be so many excellent Tracts of Practical Arithmetick extant, and fo little practifed, is to me a greater wonder ; knowing that as Merchands fe is the Life of the Weal-Publick's fo Practical Arithmetick is the Soul of Marchandize. Therefore I do ingenuously profess, that in the beginning of this Undertaking, the memerous Concords of the bonoured Merchants first possed my Consideration : And here far I have accommodated this Composure for his most worthy Service, let his own profitable Experience be judge. .-

Secondly, For your Service, most excellent Professor, whole Understandings four so the Sublimity of the Theory and Practice of this Noble Science, was this Arithmetical Fractate composed; which you may please to implay as a Momitor to instruct your young Tyroes, and shareby take occasion to referve your precious Moments, which might be exhausted that way, for your more impartant Affairs: 10 5000

Thirdly,

itized by Google

The Proeme or Preface.

Thirdly, For you, the ingenious Off-spring of happy Parents, who will willingly pay the full Price of Industry, and Exercise for those Arts and choice Accomplishments which may contribute to the Felicity of your future State. For you, I say, (ingenious Practitioners) was this Work composed, which may prove the Pleasure of your Youth, and the Glory of your Age.

Lastly, For you the pretended Numerists of this vapouring Age, who are more difingenioufly witty to propound unneeesfary Questions, than ingeniously judicious to refolve such as are neceffary. For you was this Book composed and published, if you will deny your selves so much as to invert the streams of your Ingenuity, and by studiously conferring with the Notes, Names, Orders, Progress, Species, Properties, Proprieties, Proportions, Powers, Affections and Applications of Numbers detivered herein; become fuch Artiffs indeed, as you now only seem to be. This Arithmetick ingeniously observed, and diligently practifed, will turn to good account to all that shall be concerned in Accompts. All whose Rules are grounded on Verity, and deliver'd with Sincerity. The Examples are built up gradually from the smallest Consideration to the greatest. All the Problems or Propositions are well weighed, pertinent and clear, and not one of

Chap. 1.

CHAP. I.

Notation of Numbers.

Rithmetick is an Art of Numbring or Knowledge, which teacheth to number well, (viz.) the Doctrine of Accounting by Numbers. And there are divers Species and Kinds of Arithmetick and Geometry, the which we do intend to treat of in order ; applying the Principles of the one to the Definitions of the other : For as Nagnitude or Greatnels is the fubject of Geometry, fo Multitude or Number is the fubject of Arithmetick; and if fo, then their first Principles and chief Fundamentals, muft have like Definitions; or at least, a Semblable Congruency.

2. Number is that by which the Quantity of any thing is expressed or numbered; as the Unit is the number by which the quantity of one thing is expressed or faid to be one, and two by which it is named two, and $\frac{1}{2}$ half by which it is named or called half; and the Root of 3, by which it is called the Root of 3, the like of any other.

3. Hence it is that Unit is Number, for the part is of the fame matter that is his whole, the Unit is part of the multitude of Units, therefore the Unit is of the fame matter that is the multitude of Units; but the matter of the multitude of Units is Number, therefore the matter of Unit is Number; for elfe if from a given number on number be inbracted, the number given remaineth; let three be the number given; from which number fubtract of take away one; (which as fome conceive, is no number) therefore the the second coogle n.

Det

number given remaineth, that is to fay, there remaineth three, which is abfurd.

4. Hence it will be convenient to examine from whence Number hath its rife or beginning : Moft Authers maintain that Unit is the beginning of Number, and it felf no number; but looking upon the Principles and Definitions in the first Rudiments of Geometry, we shall find, that the definition of a Point is in no way congruous with the definition of an Unit in Arithmetick; and therefore one, or Unit must be in the bounds or limits of Number, and confequently the beginning of Number is not to be found in the number one ; wherefore to make number and magnitude congruent in Princip'es, and like in Definitions, we make and conflitute a Cypher to be the beginning of number, or rather the medium between encreasing and decreasing Numbers, commonly called absolute or whole Numbers, and negative or fractional Numbers. between which nothing can be imagined more agreeable to the definition of a point in Geometry; for as a point is an adjunct number, and it felf no line, fo is (o) Cypher an adjunct of number, and it lef no number . And as a point in Geometry cannot be divided or increased into parts; fo likewise (0) cannot be divided or increased into parts; for as many points though in number infinite do make no line, fo many (o) Cyphers, though in number infinite do make no number. For the line A B A eannot be increased by the addition of the point C, neither can D E the number D be increased by the o addition of the (0) Cypher E, for if you add nothing to 6, ſum the Sum will be 6, (6) neither in-creating nor diminishing the num-۸· ber 6, but if it be granted that A B be extended or prolonged to the point C, fo that A C be made **E E 6**0 a continued line, then A B is increated by the addition of the point C, in like manChap. 1.

set if we grant D 6 be prolonged to $E(\circ)$ fo that D E (60) be a continued number making 60, then 6 is augmented by the aid of (0) as to the conflituting the maber (60) fixty; and furthermore that one or unit is material and a number, and that (0) is the beginning of number is proved by all Authors, altho' indirectly, for the Tables of Sines and Tangents prove one degree to be a number, because the Sine of 1 degree is 174924, (the Radius being 10000000) and the beginning of that Table is (0) and to it answereth 00000, Ge.

s. Hence it is that number is not quantity discontinued, for all that which is but one quantity, is not quantity disjunct, (60) fixty as it is a number, is one quantity, viz. one number (60) fixty ; therefore as it is number, it is not quantity disjunct; for number is fome fuch thing in magnitude, as humidity in Water; for as humidity extends it felf through all and every part of Water, fo number related to magnitude doth extend it felf through all and every part of magnitude. Also as to continued Water doth answer continued humidity, so to a continued magnitude doth answer a continued number. As the continued humidity of any intire Water, fuffereth the fame Division and distinction that his Water doth ; fo the continued Number fuffereth the fame division and distinction that his magnitude doth. From all which Confiderations we might enlarge a further digreffion concerning number and magnitude, by comparing the definitions of the one with the Principles of the other, for having found a (o) Cypher to be answerable in definition to a point in magnitude, we may very well conclude that number may be congruent to a line; as also the Figurative Number to be conforant in definition with a Superficies, and Solid, Gr. in the order of Geometrical Magnitudes.

6. The Characters or Notes by which Numbers are fignified, or by which a Number is ordinarily expressed are thele following, (viz.) o Cypher or nothing, 1 One, 2 Two, 3 Third, 4 Four, 5 Five, 6 Six, 7 Seven, 8 Right, 9 Nine: The Cypher, which though of it ſelf

- B 2

Chap. 1

felf fignificth nothing, (viz.) expressed not any certain or known quantity, but is the beginning, Radix, or Root of Number, and the other nine Figures or Characters archited fignificant Figures or Digits.

7. In numbers of any fort, two things are to be confidered, (viz.) Notation and Numeration.

8. Notation teacheth how to deferibe any number by certain Notes and Charafters, and to declare the value thereof being fo deferibed, and that is by Degrees and Periods.

9. A degree confifts of three figures, viz. of three places comprehending Units, Tens and Hundreds, fo 365 is a degree, and the firft figure (5) on the righthand, flands fimply for its own value, being Units or fo many ones, (viz.) five; the fecond in order from the right, fignifies as many times ten, as there are Units contained in it, (viz.) fixty'; the third in the fame order fignifies fo many hundreds as it contains Units, fo will the exprellion of the Number be, three hundred fixty five; allo 789, is feven hundred eighty nine, dyc.

10. A Period is when a Number confifts of more than three figures, or places, and whole proper order is to prick or diffinguifh every third place beginning at the right hand, and fo on to the left; fo the number 63452 being given, it will be diffinguifhed thus, 63452, and expressed thus, fixty three thousand four hundred fifty two, likewile 4.573.235.782, being diflinguished as you see, will be expressed thus, four thousand five hundred feventy 'sight' millions; two hundred thirty five thousand, feven hundred eighty two.

II. Number is either Abfolute or Negative.

12. An absolute, or intire, whole, increasing number, is that which by annexing of another Figure or Cypher it becomes ten times as much as it stood for before; and if two Figures or Cyphers be annexed, it makes it a hundred times more than it stood for betore, Or. is if you annex to the figure 6 a Cypher, then it will become (60) fixty: So if two Cyphers an

4

attinexed, then it will be (600) fix hundred, and if you do annex to it a (4) four, then it will be (64) fixty four; and if you annex (78) feventy eight, it will be then (678) fix hundred leventy eight, and fo on ; By annexing more Figures or Cyphers, it will encreale in a decuple proportion ad Infinitum.

a decuple proportion ad Infinitum. 13. A Negative, or Broken, Fractional, Decreating Number, is that which by prefixing a Point or Prick towards the left hand its value is decreafed from for many Units, to fo many tenth parts of any thing, and if a point and (c) Cypher, or a Digit be prefixed, it will be then to many hundred parts, and if a point and two Cyphers or Digits be prefixed, its Value is decreafed to be fo many thousand parts ; as if you would prcfix before the figure 3 a point (.) or prick thus (.3) it is then decreased from 3 Units or Integers, to (3) three tenth parts of an Unit or Integer; and if you prefix a Point and Cypher thus (.03) it is decreased from 3 Integers to 3 hundred parts of an Integer, and by this means 5 l. Absolute, by prefixing of a point will be decreased to 5 l. Negative, which is five tenth parts of a Pound, equal in value to ten Shilings, and fo by prefixing of more Cyphers or Digits, its value is decreated in a decuple proportion ad infinitum. As in the following Scheme, or rather order of Numbers, we have placed (o) Cypher in its due place and order, as it is both the beginning and medium of number 1 for going from (0) towards the left hand you deal with intire, abfolute, whole, increasing Numbers.

 Increasing Numbers.
 Decreasing Numbers.

But going from (0) the place of Units towards the right hand, you meet with broken, negative, fractional and decreasing Numbers. And hence it follows that B and the count of the second second

Chap. 1

Multiplication encrease the product in absolute Numbers, but decrease the product in negative Numbers. Also Division decrease the Quotient in whole Numbers, and increase th it in negative or fractional Numbers.

14. An abfolute, entire, whole, increasing Number, hath always s point annexed towards the right hand; and therefore,

15 A negative, broken, decimal, decreating Number, hath always a point prefixed before it towards the left hand. When we express Integers or whole Numbers, as 5 pounds, 5 feet, 26 men, we usually annex a l. feet.men. jush.

point or prick after the number thus, 5. 5. 26. 347. But when we express Decimals, or Numbers that are denied to be entire, as decreasing *Numbers*, we do commonly prefix a point or prick before the faid Decimal or decreasing *Number*, thus (.3), that is 3 tenths, or 3 primes, .03, that is 3 hundredths, or 3 feconds.

16. A whole or absolute Number is an Unit, or a composed multitude of Units, and it is either a prime, or else a compounded Number.

17. Prime Numbers amongst themselves are those which have no multitude of Units for a common meafurer as 8 and 7, or 10 and 13, because not any multitude of Units can equally measure or divide them without a Remainder.

18 Compound Numbers amongft themselves are those which have a multitude of Units for a common measurer, as 9 and 12, because 3 measures them ex-Adily, and abbreviates them to 3, and

19. A broken Number commonly called a Fraction, is a part or parts of a whole Number, viz. a part of an Integer, as 1 one third, is one third part of an Unit.

20. A broken Number or Fraction, confifts of 2 parts, viz. the Numerator and the Denominator.

21. The Numerator and Denominator of a Fraction, are fet one over the other, with a line between them; and the Numerator is fet above the line, and expressed the parts therein contained.

22. The denominator of a Fraction is the inferiour number placed below the line, and expressed the number of parts into which the Unit or Integer is divided ; as let 1 be the Fraction given, fo shall 3 be the numerator, and doth express or number the multitude of parts contained in this Fraction ; for # is a Fraction composed of Fourths or Quarters; and the figure 3 in numbring filews us, that in that Fraction there are 3 of those fourth parts or quarters : allo in the fame Fraction 2, 4 is the denominator, and doth express the quality of the Fraction, viz. that the whole, or Integer, is here divided into 4 equal parts.

22. A broken number is either proper or improper, viz. proper, when the numerator is leffer than the deno. minator; fo } is a perfect proper Fraction, but an improper Fraction hath its numerator greater, or at leaft equal to the denominator; thus 1 is an improper Fraction, the Reafon is given in the definition.

24. A proper broken number is either Simple or Compound, viz. Simple, when it hath one denomination ; and Compound, when it confifteth of divers denominations. It \$1. TT, Tot L were given, we fay they are either of them fingle or fimple Frattims, because they confilt but of one numerator and one denominator ; but if & of TA of the pound fterling were given, we fay, that it is a compound broken Number, or Fraction, becaufe the expression and representation confisteth of more denominations than one 3. and fuch by fome are called Frattions of Frations, and they have always this Particle (of) between them.

25. When a fingle broken Number or Fraction hath for his densminator a number confifting of a Unit in the first place towards the left hand, and nothing but Cyphers from the Unit towards the right hand, it is then the more aptly and rightly called a Decimal Fration; under this Head are all our decreasing Numbers placed, and in our 13th definition called Negative, and by that order there prefcribed, we order them to be Decimals, by figning a point or prick before them, or the numerator rejecting the densminator : Therefore ac-Digitized by GOOgle cording 64

Chap. 1.

cording to our laft Rule, τ_{1}^{s} , τ_{2}^{s} , $\tau_{$

But oftentimes, as in the fecond and fourth Frailions T_{*}^{5} and $T_{*}^{5}S_{*}^{5}$, a prick or point will not do without the help of a Cypher or Cyphers prefixed before the significant figures of the numerator, and therefore when the numerator of a decimal Frailion, conflict not of fo many places as the denominator hath Cyphers, fills up the void places of the numerator, with prefixing Cyphers before the fignificent Figures of the numerator, and then fign it for a decimal, fo fhall T_{*}^{5} be 0.5_{5} and T_{**}^{2} will be 0.25, and T_{*}^{2} will be 0.072. Now by this we may eafly diffeover the denominator of any decimal Frailion confifts of fo-many Cyphers, as the numerator hath places, with a Unit prefixed before the faid Cyphers, wiz, under the point or prick.

26. A decimal Number or Frailion, is that which is expressed by Primes, Seconds, Ibirds; Fourths, &c. and is number decreasing. Here instead of Natural and C. numon Frailions, as 3 of a thing, we order the thing or integer into Primes, Seconds, Thirds, Fourths, Fiftha, ere. that our Expression inay be consonant to our former order.

27. In Decinal Arithmetick we always imagine (and it would be very commodious if it were really fo) that all intire Units, Integers, and things are divided first into ten equal parts, and these parts to divided we, call Primes ; and fecondly, we divide also each of the former Primes into other ten equal parts, and every of these dividions we call Seconds ; and thirdly, we divide each of the full Seconds into ten other equal parts, and these to divided we call Thirds, and fo by decimating the former, and fub-decimating these latters, we run on ad infinitum.

pois-weight, Liquid-Measure, Dry-Measure, Long-Meafure, Time, Dozen, or any other thing, or lateger be given to be decimally divided ; in this notion premifed we ought to let the first Division be Primes, the next division Seconds, the next Thirds, &cc. So one prund sterling being 20 shillings, which divided into ten equal parts, the value of each part will be 2 fhillings ; therefore one Prime of a pound flerling will fland thus (.1) which is in value 2 fhillings, three Primes will fland thus (.3) and that is in value 6 fhillings. Again, a Prime or . I being divided into ten equal parts, each of those parts will be one Second, and is thus expressed, (.01) and its value will be found to be 2 d. farthing, and r of a farthing ; and fo will .05 fignifie one thilling, . or five Seconds. And if .ot be divided into ten other equal parts, each of those parts fo divided will be Thirds; and will ftand thus:001, and its value will be found to be .96 of a farthing, or -96of a farthing; and .009 Thirds will be 2d. and .64 of a farthing, or 75% of a farthing, Or. So that .375 1. will be found to reprefent 7s. and 6d:; for the 3 Primes are of fhillings; and the 7 Seconds are 13. 4d. and the bf : a penny, and the ; Thirds are i penny and 7 of a, penny, both which added together make 7 s. 8 de 29. If you put any bulk or body, representing an.

Integer if it be decimally divided, then the parts in the, firft decimation are Primes, the next Seconds, and the next decimation is Thirds, the next Seconds, and the next decimation is Thirds, the next Seconds, and the letthere begiven a Bullet of Lead, on fuch like, whole; weight Benir berge (ETroy, othis sall an Unit, Integer, or things: then with the tkike weight and matter, make so others, the which together will be equal to go h, and will weight control to get make so more, then each of thole will weight sounceaugices; take of the fame matter, and equal to git make so others in the fame of thole will weight sounceaugices; allo if again, you; take so ounces, and thereof make so other fimil Bullets, each of them will weight so peny-weight Froy; and thus have you make Frimes, Seconds, and Thirds, in respect of the Integer containing so h. Troy, and that s Primes is equal to the half mais, and 2 Primes and 5 Seconds is a quarter of the mais; and therefore s

Bş

Notation of Numbers.

Chap. Y.

of the first division, 2 of the second division, and 5 of the third division, will be equal in weight to $\frac{1}{2}$ a quarter of the mass, and contain 6 1. and 3 ounces.

30. When a decimal Fraction followeth a whole number, you are to feparate or part the decimal from the whole number, by a point or prick; fo if .75 followed the whole number 32, fet them thus 32.75. You thall find that divers Authors have divers ways in exprefing mixt numbers, as thus, 32|75, or $32_7.5$, or 32.75, or 32|75, or 32.75, or 32.75, or 32.75, or 32|75, or 32.75 thus placed and expressed is fitted for Calculation.

31. A mixt number hath 2 parts, the whole and the broken; the whole is that which is composed of Integers, and the broken is a Fraction annexed thereunto. So the mixt number $36_{T}^{\frac{3}{2}}$ being given, we fay that $36_{T}^{\frac{3}{2}}$ is the whole number, which is composed of Integers, and the $T_{1}^{\frac{3}{2}}$ is the broken number annexed, which sheweth that one of the former Integers (of that 36) being divided into 12 parts, this $T_{2}^{\frac{3}{2}}$ doth express 8 of those 12 parts more belonging to the faid 36 Integers.

32. Denominative numbers are of one, or of many, and choic are of divers forts and kinds, viz. Singular; called Unit, as 1; and Plural, called multitude ; as 2, 3, 4, 5. Single of one kind only, called digits; as 1, 2, 3, 4, 5, 6, 7, 8, 9, and Compounds of many, 10, 11, 12. Gr. 102, 369, Gr. Proportional, as Single, Multiple, Double, Triple,

Proportional, as Single, Multiple, Double, Triple, Quadruple, Gr. Denominate, as Pounds, Shillings, Pence ; Undenominate, as 1, 2, 3, Gr. Perfect; as 6, 38, 456; 8128, 130818, 2096128, Gr. whole parts are equal to the numbers; Imperfect, unequal and more than the fum, as 12 to 1, 2, 3, 4, 6. Imperfect, unequal and lefs than the fum, as 8 to 1, 2, 4. Numbers Commenfurable and Incommenfurable, as 12 and 9 are Commenfurable, becaufe 3 measures them both.

flindard. The Goldmiths have divided the ounce Troy-weight into other parts, which they generally call, Mark weight; the denominative parts thereof are as . followeth, viz. A Mark (being an ounce Troy) is di-vided into 24 equal parts, called Careets, and each Careft into 4 grains, fo that in a Mark are 96 Grains; by this weight they diffing the different finenels of their Gold; for if to the finenels of Gold he put 2 Carects of Alloy (which is of Silver, Copper, or other bafer Metal, with which they afe to mix their Gold or Silver to abate the finencis thereof) both making when cold but an ounce, or 24 Careets, then this Gold is faid to be 22 Carects fine, for if it come to be refined the 2 Carefts of alloy will fly away, and leave only 22 Carefts of pure Gold, the like to be confidered of a greater or leffer quantity; and as the finenels of Gold is effimated by Carefts, fo the finenels of Silver is diftinguish'd by ounces; for if a pound of it be pure, and lofeth nothing in the Refining, fuch Silver is faid to be twelve ounces fine ; but if it loseth any thing, it is faid to contain fo much finench as the loss wanteth of 12 ounces, as if it lole an ounce, it is faid to be II ounces fine. and if it lofe one ounce 14 penny-weight, then it is faid to be 10 ounces of penny-weight fine, and that which loseth 2 ounces 4 penny-weight 16 grants, is faid to be 9 ounces 15 penny-weight 8 grains fine, Oe. the like of a greater or leffer quantity.

Of Apothecaries Weights.

4. The Apothecaries have their Weights deduc'd from Troy-weight, a pound Iror being the greateft Integer, a Table of whole division and fub-division followeth, 1 vize

Chap. 2.

8. The leaft denominative part of Long Measure is a Barly-corn well dried, and taken out of the middle of the Ear; whole Table of parts followeth:

The Tuble of Long Measure.

3 barly-corns	} • •	[i incb
12 inches	1	1 for
z feet	t ·	i yard
3 feet 9 inches, or a yard and quarter }	ے بچر	t ell Englifu
6 feet	Ê	I fathom
5 yards and a half		I pole, perch or rod
40 poles or perches	ŀ	1 furlong
8 furlongs)	I English mile

And therefore,

mile furl. poles yards : feet inches barly-corns $1 - 8 - 40 - 5^{1} - 3 - 12 - 3$ J - 8 - 320 - 1760 - 528e - 63360 - J90:80 I - 40 - 220 - 660 - 7920 - 23760 $I - 5^{1} - 16^{1} - 198 - 594$ I - 3 - 36I - 3 - 36

And note that the yard, as allo the ell; is usually divided into 4 quarters, and each quarter into 4 Nails. Note also that a Geometrical Pace is 4 feet; and there are 1056 fuch Paces in an English raile. 2. The parts of the Superficial Mediares of Land are fuch as are mentioned in the following Table, viz.

The Table of Land Measure.

40 fquare Poles or Berches make { t Rood, or quarter of an Acre. 4 Roods } t Rood, or quarter of an Acre. 1 Acre. 1 Acre.

Of Money, Weights,

Chap. 2.

By the foregoing Table of Ling Measure, you are informed what a Pole, or (which is all one) Perch is; and by this that 40 fourre Perches are 1 Rood. Now by a fourre Perch is a superficies very aptly refembled by a fourre Trencher, every fide thereof being a Perch, or 5 Yards and a half in length, 40 of them is a Rood, and 4 Roods an Acre. So that a Superficies that is 40 Perches long and 4 broad is an Acre of Land, the Acre containing in all 150 fourre Perches.

10. The least denominative part of Time is a Minnute, the greateft Integer being a Tear; from whence is produced this following Table.

The Table of Time.

	Minute Minutes		Minute Hour
24	Hours Days	$(\underline{s})_{1}$	Dav natural Week
م	Weeks Months, I day	· · · · · · · · · · · · · · · · · · ·	Month Year.

But the Year is usually divided into 12 unequal Kalendar Months, whole Names and the number of Days that they contain, follow, suz.

January February March April May June July August September Očtober November December	31 31 30 31	So that the Year containeth 365 Days, and 6 Hours, but the 6 Hours is not seckoned but only every 4th Year, and then there is a day added to the latter end of February, and then it containeth 29 days, and that year is called Leap-year, and con- taineth 365 days.
· ·		Digitized by Google

and Measures

And here note, that as the Hours is divided into 60 Minutes, fo each Minute is fubdivided into 60 Seconds, and each Second into 60 Thirds, and each Third into 60 Fourths, Oc.

The Tropical Year by the exafteft observations of the most accurate Astronomers is found to be 365 Days, 5 Hours, 49 Minuts, 4 Seconds, and 21 Thirds.

CHAP. III.

' Of the Species or Kinds of Arithmetick.

1. A Rithmetick is either Natural, Artificial, Amalytical, Algebraical, Lineal or Infrumental.

2. Natural Arithmetick is that which is performed by the Numbers themfelves; and this is either Pofitive or Negative. Politive which is wrought by certain infallible Numbers propounded, and this either Single or Comparative; Single which confidereth the nature of Numbers fimply by themfelves; and Comparative, which is wrought by Numbers as they have relation one to another. And the Negative part relates to the Rule of Falle.

3. Artificial (by fome call'd Logarithmetical) Arithmetick is that which is performed by artificial or borrowed Numbers invented for that purpole, and are called Logarithms.

4. Analytical Arithmetick, is that which thews from a thing unknown to find truly that which is fought; always keeping the Species without Change.

5. Algebraical Arithmetick, is an obscure and hidden, Art of Accompting by Numbers in resolving of hard Questions.

6. Lineal Arithmetick, is that which is perform'd by lines fitted to proportions, as Geometrical Projections.

7. Infirumental Arithmetick, is that which is performed by Infiruments fitted with Circular and Right Lines of Proportion, by the motion of an Index, or otherwife.

Chap. 4.

8. The parts of Single Arithmetick are Numeration and the Extraction of Roots.

9. Numeration is that by which certain known Numbers propounded, we discover another Number unknown.

10. Numeration hath four Species; viz. Addition, Subtraction, Multiplication and Division.

CHAP. IV.

Of Addition of Whole Number's.

r. A Ddition is the Reduction of two or more numbers of like kind together into one Sum or Total. Or it is that by which divers numbers are added together, to the end that the Sum or Total value of them all may be diffeovered:

The first number in every Addition is called the addible number, the other, the number or numbers added, and the number invented by the Addition is called the Aggregate or Sum containing the value of the Addition.

The Collation of the numbers, is the right placing of the numbers given respectively to each decomination, and the Operation is the artificial adding of the numbers given together in order to the finding out of the Aggregate or Sam.

2. In Addition, place the numbers given respectively the one above the other, in such fort, that the like degree, place or denomination, may stand in the same Series, viz. Units under Units, Tem under Tens, Hundreds under Hundreds, Gre. Pounds under Pounds, Shillings under Shillings, Pence under Pence, Gre. Yards under Yards, Feet under Feet, Gre.

3. Having thus placed the numbers given (as before) and drawn a line under them, add them together, beginning with the leffer denomination. viz. at the right hand, and to on, fubleribing the fum under the line refpectively; as for Example.

Let '

Chap. 4,

Let there be given 3352 and 213 and 133 to be added together, I fet the Units in each particular number under each other, and fo likewife the Tens under the Tens, Oc. and draw a line under

them, as in the Margent, then I begin at the 3352 place of Units, and add them together up. wards, faying, 3 and 3 are 6 and 2 make 8, which I fet under the line, and under the fame Figures added together; then I pro-2698 ceed to the next place, being the place of \$

Tens, and add them up in the fame manner as I did the place of Units, Laying, 3 and 1 are 4 and 5 are 9, which I likewife fet under the line respectively ; then I go to the place of Hundreds, and add them up as I did the other, faying, I and 2 are 3 and 3 are 6, which I also fet under the line ; and lastly, I go to the place of Thoulands, and because there are no other Figures to add to the 32. I fet it under the line in its respective place, and fo the work is finished ; and I find the fum of the 3 given numbers to be 3698.

4. But if the Sum of the Figures of any Series exceeds ten, or any number of tens, subscribe under the fame the Excels above the tens, and for every ten carry one to be added to the next Series towards the left hand, and to go on till you have finished your addition ; always remembring, that how great foever the fum of the Figures of the last Series is, it must all be fet down under the line respectively. So 3678 being given to be added to 2357, I fet them down as is before directed, and as you fee in the Margent, with a line drawn under them, then I begin and add them together, faying, 7 and 8 are 15, 3678 which is s above 10, wherefore I fet s under 2357 the line, and carry i for the 10 to be added to the next feries, faying, I that I carried and 6095 5 is 6 and 7 are 13, wherefore. I fet down 3 and carry 1 (for the ten) to the next feries, then I fay 1 that I carried and 3 are 4 and 6 are 10, now because it comes to just 10 and no more, I fet o under the line and carry I for the 10 to the next, and fay, I

212

132

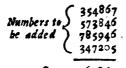

Mat

∗, Google

Addition of

Chap. 4-

that I carried and 2 are 3, and 3 are 6, which I fet $0 \le 1$ in its respective place, thus the addition is ended, and the total Sum of these Numbers is found to be $0 \le 3$, formal Examples of this kind follow.

- Sum 2051864

Numbers to be added Sum 1939264 Numbers to 748647 76483 be added Sum 1939264 Sum 92856

5. If the Numbers given to be added, are contained under divers Denominations; as of Pounds, Shillings, Pence and Farthings; or of Tuns, Hundreds, Quarters, Pounds, &cc. Then in this cafe having difpoled of the Numbers, each denomination under other of like kind; beginning at the leaft denomination, minding how many of one denomination do make an Integer of the next greater denomination that you find therein contained, bear an Unit in mind to be added to the faid next greater denomination, expressing the excets respectively under the line, proceed in this manner until your Addition be finisting it to be added, viz. 136 l. 13 e. 4d. 2 grs, and 79 l. 93 s. 10 d. 3 grrs. and 33 l. 18 s. c9 d. 1 gr. also 15 l. 09 s. 05 d. 0 gr. The Numbers being disposed according to order will fland as in the Margent. Then I being at the denomination of Farthings,

initized by GOOD

and

22

and add them up, faying, I and 2 are 4 and 2 make 6, now I d qrs. 1. 5. confider that 6 Farthings is 1 136-13-04-2 Penny and 2 Farthings, wherefore I fet down the 2 Farthings 33-18-09-1 in its place under the line, and 15-09-05-0 keep i in mind to be added to the next denomination of Pence ; .. 265-09-05-2 then I go on, faying I that I carried and 5 are 6 and 9 are 15 and 10 are 25 and 4 are 29, now I confider that 29 pence are's millings and s pence, whereof I fet the s pence in order under the line and keep 2 in mind for the 2 shillings, to be added to the shillings; then I go on, faying, that 2 I carried and 9 are 11, and 18 are 29, and 7 are 36, and 12 are 49; then I confider that 49 fhillings are 2 pounds and 9 thillings, wherefore I fet the 9 thillings under the line, and carry 2 for the 2 pounds, to the next and last denomination of pounds, and proceed, faying 2 that I carried and 5 make 7, and 3 are 10, and o are 19, and 6 are 25; then I fet down 5, and carry 2 for the tens, and proceed, faying, 2 that I carry and 1 is 3, and 3 are 6, and 7 are 13, and 3 make 16; I fet down 6 and carry 1 for the 10, and go on, faying 1 that I carried and 1 are 2, which I fet in its place under the line, and the work is finished; and thus I find the Sum of the forefaid Numbers to be 2651. 95. 5d 2 grs. This to the ingenious Practitioner is lufficient, but Fihall (for the further illuminating of weaker apprehensions) explain the operation of another Example in Troy-weight ; and here the Learner must take notice of the Table of Troy-weight mentioned or fet down in the third Section of the fecond Chapter. The Numbers -given in this Example are 38 l. 7 oz. 13 p.w. 18 gr. and 50 l. 10 ez. 10 p.w. 12 gr. and 42 l. 08 ez. 05 p.w. 16 gr. and in order to the Addition thereof, I place them as you fee, and proceed to operation; faying 16 and 12 are a8; and 18 are 46; now because 24 grains make 1 penny

Digitized by Google

Addition of

enny-weight, 46 grains are enny-weight and 22 grains; retore 1 fet down 22, and y 1 for the penny-weight, and ig on 1 fay, 1 that I carry and ake 6, and 10 are 16, and 13 29, which is one ounce and Chap. 4. 1. oz. p.w. gr. 38-7-13-18 50-10-10-12 42-08-05-16 132-02-09-22

Inny-weight, I fet down 9 in its place under the line, carry 1 to the ounces, faying 1 that I carry and 8 9, and 10 are 19, and 7 are 26, and becaufe 26 ces make 2 pound 2 ounces, I fet down 2 for the ces, and carry 2 to the pounds: going on, 2 that rry and 2 are 4, and 8 make 12, that is 2 and go 15 n 1 carry and 4 are 5, and 5 are 10, and 3 are 13, ch I fet down as in the Margent, and the work is fited, and I find the fum of the faid numbers to amount 1321. 202. 9 p.w. 22 gr. This is fufficient for the lerftanding of the following Examples, or any other ?, the full come to thy view. The way, of proving ?, or any Sums in this Rule, is flowed immediately r the enfining Examples.

Addition of

Chap. 4.

Addition of Dry Measure.

whole Numbers.

Chap. 4.

The Proof of Addition.

6. Addition is proved after this manner, when you have found out the fum of the Numbers given, then feparate the uppermost line from the reft, with a ftroke or dailh of the pen, and then add them all up again as you did before, leaving out the uppermost line, and having fo done add this new invested fum to the uppermost line you feparated, and if the fum of those two lines be equal to the fum firft found out, then the work was performed true, otherwife not. As for Example, Let us prove the firft Example of Addition of Money, whole fam we found to be 2651. 95. 5d. 2975. and which we prove thus, having

feparated the uppermost number from the reft, by a line as you fee in the Margent, Then I add the fame together again, leaving out the faid uppermost line; and the fami thereof I for under the first fum or true fum, which doth amount to 1291. 16 s. of d. o qrs. then again I add this newfum to the uppermost line that before was feparated from the reft, and the fum of these two is 26 s1. 69 s. c5 d. 2 qrs. the

 $\begin{array}{c} l. \quad s. \quad d. \ qrs\\ 136-13-04-2\\ \hline 79-07-10-3\\ 33-18-09-1\\ 15-09-05-0\\ \hline 265-09-05-0\\ \hline 128-16-01-0\\ \hline 265-09-05-2\\ \hline \end{array}$

fame with the first futn, and therefore I conclude that the Operation was rightly performed.

7. The main end of Addition in Queffions Refolvable thereby, is to know the furn of teveral Debts, Parcels, Integers, Gr. Some Queffions may be these that follow.

Queff. 1. There was an Old Man whole Age-was requited, to which he replied. Phave feven Sons,' each having two years between the birth of each other, and in the 44 year of my Age my elder Son was born, which is now the Age of my youngeft; I demand what was the Old Man's Age? ...? the Google

Now to refolve this Queftion, first fet down 44 the Fathers Age at the birth of his first Child, · 12 which was 44, then the difference between the 44 eldeft and the youngeft, which is 12 years, and then the Age of the youngest which is 44, and 100 then add them all together, and their fum is 100 the compleat Age of the Father.

Queft. 2. A Man lent his Friend, at feveral times,these several Sums, (viz.) at one time 63 l. at another time 50% at another time 48% at another time 1561. now I defire to know how much was lent him in all. l.

Set the Sums lent one under another, as 63 you fee in the Margent, and then add them . 50 together, and you will find their Sum to a- 48: mount to 317 2. which is the Total of all the 156 feveral Sums lent, and fo much is due to the 317 Creditor.

Quest. 2. From Landon to Ware is 20 miles, thence to Huntington 29 miles, thence to Stamford 21 miles, thence to Tuxford 36 miles, thence to Wentbridge 25 miles, from thence to Tork 20 iniles. Now I defire to know how many miles it is from London to Tark according to this reckoning.

Now to answer to this Question, fet down the feyeral diftances given, as you fee in 29 2 T the Margent, and add them together, and 36 . you will find their Sum to amount to 151, 25 which is the true diftance in miles between. London and Terk. 151

Quest. 4. There are two numbers, the leaft whereof is 40, and their difference is 14, I defire to know what is the greatest Number, and also what is the Sum of them both ? First, set down the greates . least least, viz. 40, and 14 the difference, and add them together, and their fum is 54 for the greatest number, then I

ſet

Chap. 4.

Cháp. s.

fet 40 (the least) under 54 (the greatest) and add them together, and their sum is 94 equal to the greatest and least numbers.

CHAP. V.

Of Subtraction of Whole Numbers.

1. CUbtrattion is the taking of a leffer Number out) of a greater of like kind, whereby to find out a third Number, being or declaring the inequality, excess, or difference between the numbers given; or Subtraction is that by which one number is taken out of another number given, to the end that the refidue or Remainder may be known, which Remainder is also called the Reft, Remainder, or Difference of the numbers given.

2. The number out of which Subtraction is to be made. must be greater, or at least equal with the other number given, the higher or fuperiour number is called the major number, and the lower or inferiour is called the minor number ; and the Operation of Subtration being finished, the Reft of Remainder is called the Difference of the Numbers given.

3. In Subtraction place the Numbers given respectively, the one under the other, in fuch fort as like dcgrees, places or denominations, may fland in the fame Series, viz. Units under Units, Tens under Ters. Gr. Pounds under Pounds, Gc. Feet under Feet, and Parts under Parts, Gc. This being done, draw a line underneath, as in Addition.

4. Having placed the Numbers given as is before direfted, and drawn the line under them, fubtract the Houser Namber (which in this cafe mult always be leffer than the appermoft) out of the higher Number, and subscribe the difference or remainder respectively below the line ; and when the Work is finished, the number 7

C 2

Chap. 5.

number below the line will give you the remainder : As for Example, let 364521 be given-to be fubtracted from 795836, I fet the leffer under the greater as in the Margent, and draw a line under them, then beginning at the right hand, I fay, I out of 6 and there remains 5, which I fet 795836 in order under the line; then 1 proceed 364521 to the next, faying, 2 from 3 refts I, which I note also under the line, and 431315 thus I go on until I have finished the work, and then I find the Remainder or Difference to be 431315.

5. But if it so happen (as commonly it doth) that the lowermost number or figure is greater than the uppermoft; then in this cafe add ten to the uppermost number, and fubtract the faid lowermost numter from their Sum, and the remainder place under the Line, and when you go to the next Figure below. ray an Unit by adding it thereto for the ten you borrowed before, and subtract that from the higher number or figure ; And thus go on until your Subtraction te finished. As for Example ; Let 437503 be given, from whence it is required to fubtract 153827, I difpole of the numbers as is before directed, and as you fee in the Margent; then I begin, faying, 7 from 3 I cannect, but (adding 10 thereto I fay) 7 from 12 and there remains 6, which I fet under the Line in order; then I proceed to the 437503 next Figure, faying, 1 that I borrowed 153827 and 2 is 3 from 0 I cannot, -but 3 from -10, and there remains 7, which I like- 282676 wife fet down as before ; then I that I porrowed and 8 is 9 from 5 I canner, but 9 from 15 and there remains 6; then 1 I borrowed and 3 is 4 from 7 and there remains 3.5 then 5 from 3 I cannot, but 5 from 13 and there remains 8; then I I borrowed and I are 2 from 4 and there refts 2; and thus the Work is finished ; And after these numbers are subtracted one from another, the Inequality, Remainder, Excels or Difference, is found to be 282676.

283676. Examples for thy further Experience may be thele that follow.

6. If the Sum or Numbers to be fubtracted are of feveral Denominations, place the lefter fum below the greater, and in the fame rank and order as is fhewed in Addition of the fame Numbers; then begin at the right hand and take the lower Number out of the uppermost if it be leffer; but if it be bigger than the uppermost, then borrow an Unit from the next greater Denomination, and turn it into the Parts of the he's Denomination, and add those parts to the uppermost Number, and from their fum fubtraft the lowermost. noting the remainder below the Line; then proceed and pay I to the next Denomination for that which you borrowed before, and proceed in this order until the work be figished. An Example of this Rule may be this that followeth, let 3751. 13 s. 07 d. 1 gr. be given, from whence let it be required to subtrast 57 1. 16 s. 02 d. 2 grs. In order whereunto I place the Numbers as you fee in the Margent, and thus I begin at the least l. s. d. grs Denomination, faying, two from 375-13-07-1 one I cannot, therefore I borrow 57-16-02-2 one penny from the next Denomination, and turn it into far-217-17-03things, which is 4, and adding

4 to 1 which is 5, I fay, but 2 from 5 and there remains 3, which I put under the line; then going on, I fay, 1 that I borrowed and 3 is 4 from 7 and there refts 3; then going on, I fay, 16 from 13 I cannot, (but borrowing one pound and turning it into 20 fhillings, I add it to 13, and that is 33) wherefore I fay, fixteen from 33, and there remains 17, which I fet under the Line and go on, faying, I that I borrowed and γ is 8 from 5 I cannot, but 8 from 15, and there remains 7; the one that I G 4 borSubtraction of

Chap. 5. borowed and s is 6 from 7 there refts 1, and 0 from 3 refts 3, and the work is done : And I find the remainder or difference to be 317 L. 17 s. 03 d. 3 grs.

Another Example of Troy-weight may be this, I would fubtraft 17 1. 10 07. 11 pm. 20 gr. from 24 1. cs oz. '00 p.w. 68 gr. I place

1.

07. p.w. gr.

1 firft

24-05-00-08

06-06-08-12

17-10-11-

the Numbers according to the Rule; and begin, faying, 20 from 8 I cannot, but borrow & Pennyweight, which is 24 Grains, and add them to 8, and they are 32, wherefore I lay 20 from 22 reft 12; then I that I borrowed and

32

11 is 12 from 00 I cannot, but 12 from 20 (borrowing an Ounce which is 20 Penny-weight) and there femains 8, then I that I borrowed and 10 is II from s I cannot, but 11 from 17 and there refts 6; then 1 that I borrowed and 7 is 8 from 4 I cannot, but 8 from 14 and there refts 6; then I that I borrowed and I is'a from 2 and there refts nothing ; fo that I find the remainder or difference to be 61. 6 or. 8 p.w. 12 gr.

7. It many times happeneth that you have many Sums or Numbers to be fubtralled from one number ; as suppose a Man should lend his Friend a certain sum of Money, and his Friend hath paid him part of his Debt at feveral times, then before you can conveniently know what is fill owing, you are to add the feveral Numbers or Sums of Payment together, and subtract their Sum from the whole Debt, and the remainder is the sum due to the Creditor : As suppose A lendeth to E 5541. 125. 10 d. and B s. d. hath repaid him 79 l. 16 s. Lent 554-13-10 od d- at one time, and 1631. 185. 11 d. at ano-Paid at (75-16-08 feveral ther time, and 241 L 155 163-18-11 old at another time; and Payments (241-15-08 you would know how the Accompt flandeth between Paid in all 485-11-02 them, or what is more due : A. In order whereunto Remains G797€02----⊃7

Chap. 5.

I first let down the Sum which A lent, and draw a line underneath it, then under that line let the leveral Sums of Payment'as you'see in the Margent; and having brought the feveral Sums of Payment into one total by the fifth Rule of the fourth Chapter foregoing, J find their Sum amounteth to 4851. 115. 3.d. which I fubtraft from the Sum first lent by A, by: the fixth Rule of this Chapter, and I find the remainder to be 791. 25. 7 d- and for much is ftill due to A.

When the Learner hath good knowledge of whathath been stready delivered in this and the foregoing Chapter, he will with eafe understand the manner ofworking the following Examples.

then is your Operation true, otherwile falle; thus let us prove the first Example of the fifth Ru'e of this Chapter, where after Subtracti-437502 on is ended, the Numbers fland as in the 152827 Margent; the remainder or difference being 283676. Now to prove the Work, I 282676 add the faid. Remainder 283676 to the minor number 153827, by the fourth Rule of 437503 the foregoing Chapter, and I find the Sum or Aggregate to be 437503 equal to the ma-153827 jor Number, or Number from whence the 283676 leffer is subtracted. Behold the Work in the Margent. 437503

The Proof of another Example may be of the first Example of the fixth Rule of this Chapter, where it is required to subtract 57 l. 16 s. 03 d. 2 grs. from 3751. 13 s. 07 d. 1 gr. and by the Rule I find the Remainder to be 317 f. 17 s 03 d.

3 grs. now to prove it, I add the 19 Remainder 3171. 171. 03 d. a gree. to the minor number 57 1.-16 s. 03 d. 2 grs. and their fum is 375 /. 13 1, 07 d. 1 gr. equal to the major number, which proves the work to be true, but if it had happened to have been either more or lefs than the faid major

number, then the Operation had been faile.

9. The general effect of Subtraction is to find the differences or excels between two numbers, and the reft when a payment is made in part of a greater Sum, the date of Books printed, the age of any thing by knowing the prefent year, and the year wherein they were made, created or built, and fuch like.

The Questions appropriated to this Rule are such as 6.11.044

Chap. 5.

Queft. 1. What difference is there between one thing of 125 foot long and another of 66 foot long ?

To refolve this Quefion, I firft fet down the major or greater, number 125, and under 128 it the minor or leffer number 66, as is djrected in the third Rule of this Chapter and according to the fourth Rule of the fame, 59 I fubtract the minor from the major, and the Remainder, Excels or Difference, I find to be so. See the Work in the Margent.

Quest. 2. A Gentleman oweth a Merchant 565 1. whereof he hath paid 278 L what more doth he owe ?

To give an Anjoyer to this Queslion, I first -fet down the major number 3651 and under 365 it I place 278 the minor, and fubtract the one 278 from the other, and thereby I discover the Excess, Difference or Remainder to be 87, 87 and so much is still due to the Creditor; as per Margent.

Queft. 3. An Obligation was written, a Book printed, a Child born, a Church built, or any other thing, made in the year of our Lord 1701 1572, and now we account the year of our 1572 Lord 1-01, the Queftion is to know the Age of the faid things, that is, how many Years 129 are pathed fince the faid things were made? I fay, if you fubtsaft the leffer number 1572, from the greater 1701, the remainder will be 129, and fo many Years are path fince the making of the faid things; as by the Work in the Margent.

Quest. 4. There are three Towns lie in a fireight line, viz. London, Huntington, and Tork, now the diftance between the farthest of these Towns, viz. London and Tork is 151 miles, and from London to Huntington is 49 miles, I demand how far it is from Huntington to Tork. To refolve this Queflion, fubtract 49 the diflance between London and Huntington, from 15T 151 the diffance between London and Tork, 49 and the Remainder is 102, for the true diffance between Huntington and Tork. See the Work in 102 the Margent.

CHAP. VI.

Of Multiplication of Whole Numbers.

1. M Ultiplication is performed by two Numbers of like kind for the production of a third, which thall have fuch reaford to the one, as the other hath to a Unit, and in effect is a most brief and artificial compound Addition of many equal Numbers of like kind into one Sum. Or Multiplication is that by which we multiply two or more Numbers, the one into the other, to the end that their Product may come forth, or be diffevered.

Or, Multiplication is the increasing of any one number by another: fo often as there are Units in that Number, by which the other is increased, or by having two Numbers given to find a third, which shall contain one of the Numbers as many times as there are Units in the other.

2. Multiplication hath three parts: First, the Multiplicand, or number to be multiplied. Secondly, the Multiplier, or number given, by which the Multiplicand is to be multiplied. And Thirdly, the Product, or number produced by the other two, the one being multiplied by the other, as if 8 were given to be multiplied by 4; I fay 4 times 8 is 32, here 8 is the Multiplicand, and 4 is the Multiplier, and 32 is the Product.

3. Multiplication, is either fingle by one Figure ; or compound, that confifts of many. Google Single Chap. 6,

Single Multiplication is faid to confift of one figure, becaufe the Multiplicand and Multiplier confift each of them of a Digit, and no more, so that the greatest Product that can arise by fingle Multiplication is 8 t, being the square of 9; and Compound Multiplication is said to confiss of many Figures, because the multiplicand or multiplier confiss of more places than one; as if I were to multiply 436 by 6, it is called Compound, because the multiplicand 436 is of more places than one; (viz.) 3 places.

4. The Learner ought to have all the varieties of Single Multiplication by heart before he can well proceed any further in this Art, it being of most Excellent Use, and none of the following Rules in Arithmetick but what have their principal dependance thereupon, which may be learnt by the following Table.

Multiplication Table.

ï	2	3	4	. 5	6	7	8	9
2	. 4	6	8.	Ϊ́ρ	12	14.	16	18
3	6	9	.12	15	18	21	24	27
4	8	12	16	20	21	28	32	35
15	10	. 15 -	20	25.	30	35	. 40	45
6	12	18	24	30	36	42	48	54
7	14	-21	28	35	42	'49	56	63
8	16	24	3,2	40	48	56	54	72
9	18.	27	36	. 45	- 54	63	72	8,1

The use of the precedent Table is this. In the uppermost Line or Column you have expressed all the digits from t to 9; and likewise beginning at 1 and going downwards in the fide Column you have the fame; fo that if you would know the Product of ny

any two fingle Numbers multiplied by one another, look for one of them (which you pleafe) in the uppermoft Column, and for the other in the fide Column, and running your eye from each figure along the refpective Column, in the common Angle (or place) where these two Columns meet, there is the product required. As for Example, I would know how much is 8 times 7; firft, I look for 8 in the uppermoft Column, and 7 in the fide Column; then do I caft my eye from 8 along the Column downwards from the fame, and likewife from 7 in the fide Column, I caft my eye from thence towards the right-hand, and find it to meet with the firft Golumn at 56, fo that I conelude 56 to be the Product required, it would have been the fame if you had looked for 7 in the top, and 8 on the fide, the like is to be underflood of any otherfuch Numbers. The Learner being perfect herein, it will be neceffary to proceed.

5. In compound Multiplication; if the Multiplicand confifts of many places, and the Multiplier of but one Figure ; first fet down the Multiplicand, and under it place the Multiplier in the place of Units, and draw a Line underneath them ; then begin. and multiply, the Multiplier into every particular Figure of the Multiplicand, beginning at the place of Units, and fo proceed towards the left-hand, fetting each particular Product under the Line, in order as you proceed, but if any of the Product exceed to or any number of Tens, fet down the Excels, and for every 10 carry a Unit to be added to the next Product, always remembring to fet down the total Product of . the laft Figure; which Work being finished, the Sum or Number placed under the Line shall be the true and Total Product required. As for Example, I would multiply 478 by 6, first I set down 478, and underneath it 6 in the place of 478 Units, and draw a Line underneath them, б as in the Margent, then I begin, faying, 6 2868 times 8 is 48, which is 8 above 4 Tens, therefore I fer. down 8 (the Excels) and

bear

bear 4 in mind for the 4 tens, then I proceed; faying, 6 times 7 is 42, and 4 that I carried is 46, I then fet down 6 and carry 4, and go on, faying 6 times 4 is 24, and 4 that I carried is 28, and becaule it is the laft figure, I fet it all down, and fo the work is finished, and the product is found to be 2868, as was required.

6. When in compound Multiplication the inultiplier confifteth of divers places, then begin with the figure in the place of Units in the multiplier, and multiply it into all the figures in the multiplicand, placing the product below the line as was directed in the laft Example; then begin with the figure of the fecond place of the multiplier, (viz.) the place of Tens, and multiply it likewife into the whole multiplicand (as you did the first figure, do in the fame manner by the third, fourth and fifth, Grc. until you have multiplied all the figures of the multiplier particularly into the whole multiplicand, fill placing the product of each particular figure under the product of its precedent figure; herein observing the following Caution.

In the placing of the product of each. A Caution. particular figure of the multiplice, you are not to follow the 2d Rule of the 4th Chapter, viz. not to place Units under Units, and Tens under Tens, Gr. but to put the Figure or Cypher in the place of Units of the fecond line under the fecond figure or place of the Tens in the line above it, and the figure or Cypher in the place of Units of the third line under the place of Tens in the fecond line, Gr. Obferving this order till you have finished the Work, viz. ftill placing the first Figure of every line or product under the fecond Figure or place of Tens in that which was above it, and having fo done, draw a line under all thefe particular products, and add them together; fo fhall the fum of all thefe products be the total product required.

As if it were required to multiply 764 by 27, I fet them down the one under the other, with a line drawn under

Multiplication of

Ghap. 6.

754

5348 1528

20628

5486

465

More

27

underneath them; then I begin, faying, 7 times 4 is 28, then I fet down 8, and carry 2, then fay 7 times 6 is 42, and 2 that I carried is 44, that is 4 and go 4; then 7 times 7 is 49, and 4 that I carry is 53, which I fet down because I have not another Figure to multiply; thus have I done with the 7, then I begin with the 2, faying, 2 times 4 is 8, which I fet down under (4) the fecond bigure or

place of Tens, in the Line above it, as you may fee in the Margent : Then I proceed, faying, 2 times 6 is 12, that is two and carry one, then 2 times 7 is 14, and I that I carry, is 14, which I fet down because 'tis the product of the last Figure ; so that the product of 764 by 27 is 5348, and by 2 is 1528, which being placed the one under the other, as before is directed, and as you see in the Margent, and a Line drawn under them, and they added together respectively, make 20628 the true product required, being equal to 27 times 764.

Another Example may be this ; Let it be required to multiply \$486 by 465, I dispose of the Multiplicand and Multiplier, according to the Rule, and begin multiplying the first figure of the Multiplier, which is 5 into the whole Multiplicand, and the Product is 27430 27430; then I proceed and multiply the 32916 fecond figure (6) of the Multiplier into the 21944 Multiplicand, and find the Product to amount to 32916, which is subscribed under 2550990 the other Product respectively, then do I multiply the third and last figure (4) of the

Multiplier into the Multiplicand, and the Product is 21944, which is likewile placed under the fecond Line respectively; then I draw a Line under the faid Product (being placed the one under the other according to this Rule) and add them together, and the fum is 2550990, the true Product fought, being equal to 5486 times'465, or 465 times 5486. Compendiums in Maltiplication.

7. Although the former Rules are fufficient for all Cafes in Multiplication, yet

becaule in the Work of Mulinfication many times great labour may be laved, I shall acquaint the Learner with fome Compendiums in order thereto, viz. If the Multiplicand or Multiplier, or both of them end with Cyphers, then

Chap, 6.

in your multiplying you may neglect the Cyphers, and multiply only the fignificant Eigures, and to the Product of those fignificant Figures, add so many Cyphers as the Numbers given to be multiplied did end with;

that is, annex them on the Right-hand of the faid Product, fo shall that give you the true Product required. As if I were to multiply 32000 by 4300, I fet them down in order to be multiplied as you fee in the Margent, but neglecting the Cyphers in both numbers, I only multiply 32 by 43, and the Product I find to be 1376, to which I annex the 5

find to be 1376, to which I annex the 5 Cyphers that are in the Multiplicand and Multiplier, and then it makes 13760000 for the true Product of 32000 by 4300.

Si e numeria propulitis unus vel uterque adjunitus habeat ad dextram circulos 3. omiffie. circulti fati ipforum numetorum multiplicatio, & fatto demum toi influer integroum loci accenfeantur quot funtomifficirculti in utroque fattore, Clauis Mat.c. 4. 3.

8. If in the multiplier Cyphers are placed between fignificant figures, then multiply only_by the fignificant Figures, neglecting the Cyphers, but here special notice is tobe taken of the true placing of

the first figure after the neglect of fuch Gypher or Cyphers; and therefore you must observe in what place. of the multiplier the figure you multiply by flandeth, and let the first figure of that product under the fame place of the product of the first figure of your multi-. plier : As for Example, let it be required to multiply 371568 by 40007, first I multiply the

multiplicand by 7, and the product is 2600976, then neglecting the Cyphers I multiply by 4, and that product is 1486272; now I confider that 4 is the fifth figure in the multiplier, therefore I place two (the first figure of the product by 4) under the fifth place of the first product by 7, and

the reft in order, and having added them together, the total product is found to be 14865320976. Other Examples in this Rule are these following;

327586 6030	:	7864371 20604
9827520 1965516		3145748 <u>4</u> 47186226
1975343580		15738742

9. If you are to multiply any Number by an Unit with Cyphers, (viz.) by 10, 100, 1000, Oc. then annex to many Cyphers before the Multiplicand, and that number when the Cyphers are annexed is the product required ; as if you would multiply 428 by 100, -nex two Cyphers to 428 and it is 42800 g If it were required

whole Numbers.

required to multiply 102 by 1000, annex 4 Cyphers, and it gives 102000 for the Product required.

The Proof of Multiplication.

to. Multiplication is proved by Division, and to speak truth all other ways are falle; and therefore it

will be most convenient in the first place to learn Division, and by that to prove Multiplication. There is a Way (at this day generally used in Schools) to prove Multiplica-

Chap. 6.

1.1

Nev est quod aliam expettee examinandes viam ; nem alia vhighres & falfa fant, & nullo innixa fundamento, Genma Frisue,

tion, which is this, first add all the Figures in the Multiplicand together, as if they were simple Num-bers, cafting away the Nines as often as it comes to fo much, and noting the remainder at laft, which in this cafe cannot be fo much as 9 : Caft likewife the Nines out of the Multiplier as you did out of the Multiplicand. and note that remainder; then multiply the Remainders, the one by the other, and caft the Nines out of the Product, oblerving the Remainder; and laftly, cafe the Nines out of the total Product; and if this Remainder be equal to the Remainder last found, then they. conclude the Work to be rightly performed : but there may be given a thousand (nay infinite) false Products. in Multiplication, which after this manner may be proved to be true, and therefore this way of provi. g doth not deferve any Example; but we thall defer the proof of this Rule till we come to prove Division, and then we fhall prove them both together

11. The general effect of Multiplication is contained in the definition of the lame, which is to find out a third number, locaten-containing one of the two given Numbers as the other contain th Units.

The fecond effect is by having the length and breadth of any thing (23.3 Parallelogram, or long Plane) to find the fuperficial Content of the fame, and by having the fuperficial Content of the Bafe, and the length to find out the folidity of any Parallelipipedon, Cylinder, or other folid Figures.

-45

Chap. 6

of

The third Effect is by the Contents, Price, Value, Buying, Selling, Expense, Wages, Exchange, fimple Interest, Gain or Loss of any one thing, be it Money, Merchandize, drc. to find out the Value, Price, Expence, Buying, Selling, Exchange, or Intereft of any number of things of like Name, Nature and Kind.

The fourth Effect is (not much unlike the other) by the Contents, Value, or Price of one part of any thing denominated, to find out the Content, Value, or Price of the whole thing, all the parts into which the whole is divided, multiplying the price of one of thole parts.

Theififth Effect is, to aid; to compound, and to make other Rules, as chiefly the Rule of Proportion, called the Golden Rule, or Rule of Three, allo by it, things of one denomination are reduced to another.

If you multiply any number of integers or the price of the Integer, the product will discover the price of the Quantity or Number of Integers given.

In a Restangular Solid, if you multiply the breadth of the Bale by the depth, and that product by the length, this last product will discover the Solidity or Content of the fame Solid: ""

Some Questions proper to this Rule may be these following.

Quest. 1. What is the Content of a square piece of Ground, whole length is 28 Perches, and breadth 12 Perches ?

Anfw. 364 Iquare Perches; for multiplying 28 the length by the breadth, the product is formuch.

Quest. 2. There is a square Battle whole Flank is 47 Men, and the Files 19 deep, what number of Men doth that Battle contain ? Facit 893 ; for multiplying 47 by 19, the product is 893. Quest. 3. If any one thing cost 4 Shillings, what fhall

9 fuch things coft ? An/w. 36 Shillings ; for multiplying 4 by 9, the product is 36. Queft. 4. If a piece of Money or Merchandize be

worth or coft 17 Shillings, what fhall is fuch pieces

whole Numbers.

Chap. 6.

of Money or Merchandize coft ? Facit 323 fhillings, which is equal to 16 l. 3.3.

Queft, 5. If a Soldier or Servant get or spend 14 s. per Month, what is the Wages or Charges of 49 Soldiers or Servants for the same time ? Multiply 49 by 14, the Product is 686 s. or 341.6 s. for the Answer.

Queft. 6. If in a day there are 24 hours, how many hours are there in a year, accounting 365 days to conflitute the year? Facit 8760 hours; to which if your add the 6 hours over and above 365 days, as there is in a year, then it will be 8766 hours; now if you multiply this 8766 by 60, the number of minutes in an hour, it will produce 325960 for the number of minutes in a year;

CHAP. VII.

Of Division of Whole Numbers.

1. DiNumber or Quiantity, given into any parting of any: figued 3' or to find how often one Number is sontained in another to Or; from any two Nambers given to find a third that fhall confift of fo many bisits, as the one of thole two given Numbers is comprehended or contained in the other when the or particulation of the

32. Division bath bired Parts or Numbers remarkable, viz. Einstuthe Dividend Steandby, the Division! Thirdly y the Quotient. The Dividend is the Number given to be quotient. The Dividend is divider of it is the Number which the Dividend is divided : Or it is the Number which the weth how many parts the Dividend is to be divided into it. And the Quotient is the Number produced by the Division of study two given Numbers, the one by the other.

So 12 being given to be divided by 3, os into three equal parts, 'the Qustient will be 4, for 3 is contain'd in 12 four times, where 12 is the Dividend, and 3 is the Divisor, and 4 is the Qustient. 3. In 48

Chap. 7. 2. In Division fet down your dividend, and draw a crooked line at each end of sit, and before the line at the left-hand, place the divisor, and behind that on

the right-hand, place the Figures of the quotient, as in the Margent, where it is 3) 12 (4 required to divide 12 by gie Firft, Liet

down 12 the dividend, and on rach fide of it. do I draw a crooked line and before that on the left hand do I place g the divitor ; then do I feek tow often 3 is contained in 12, and because I find it 4 times, I put 4 behind the crooked line on the right-hand of the dividend, denoting the quotient.

4. But if when the divisor is a fingle Eigure, the dividend confisteth of two or more places, then .(having placed them for the Work as is before directed) put a point under the first figure on the left-hand of the dividend, provided it be bigger than (or equal to) the divisor, but if it be lefter than the divisor, then put a point under the second figure from the lefthand of the dividend, which figures as the as the point goeth from the left-hand are to be reckoned by themselves, as if they had no dependence upon the other part of the dividend, and for diffinction lake may be called the dividual ; then ask how often the divisor is contained in the dividual, ... plucing the Anfwer in the quotient; then multiply the divisor by the figure that you placed in the quotient, and let the product thereof under the dividual; then draw a line under that product, and fubtract the faid product from the dividual, placing the remainder under the faid line, then put a point under the next figure in the dividend, on the right-hand of that which you put the point before, and draw it down, placing it on the right hand of the remainder; which you found by Subtraction ; which remainder with the faid figure annexed kelore it, faall be a new dividual ; then feek again how often the divifor is contained in this new dividual; and put the Answer in the quotient on the right-hand of the figure which you put there before, then multiply the divisor by the laft figure that you and , just

put in the Quotient, and subscribe the product under the dividual, and make Subtraction, and to the remainder draw down the next figure from the grand dividend; (having first put a point under it) and put it on the right hand of the remainder for a new dividual as before, Gre and proceed thus till the Work is finified.

Observing this general Rule in all kinds of Division. first to feek how often the divisor is contained, in the dividual; then (having put the Answer in the Quotient) multiply the divisor thereby, and subtract the product from the dividual. An Example or two will make the Rule plain. Let it be required to divide 2184 by 6. I difpole of the Numbers given as is before directed, and as you fee in the Margent, in order to the Work ; then (because 6)1184(. 6 the divisor is more than 2 the first Flgure of the dividend) I put a point ander 1 the fecond Figure, which makes the 21 for the dividual, then do I ask how often 6 the divifor is contained in 21, and because I 6)2184(3 cannot have it more than 3 times, I out a in the Quotient, and thereby do I 18 multiply the divisor (6) and the product by 18, which I fet in order under the dividual, and subtract it therefrom, and the remainder (3) I place in order under the line; as you fee in the Margent.

Then do I make a point under the next Figure of the dividend being 8, and 6)2184(36 draw it down, placing it before the remainder 2, fo have 1, 28, for a new dividual, then do I feek how often o is contained in 38, and becaufe I cannot have more than 6 times, L put 6 in the Quotient, and thereby do I multiply the divifor 6, and the product (36) I put under the dividual (38) and subtract it therefrom, and the remainder 21 put under the Line, as you fee in the Margent.

Many

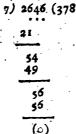

Joogl

Then do I put a point under the next (and laft) figure of the dividend (being 4) and draw it down to the remainder 2, and putting 6)2184(264 it on the Right-hand thereof, it mar keth 24 for a new dividual; then I feek how often 6 is contained in 24, and the Answer is 4, which I put in the quotient, and multiply the divisor (6) thereby; and the product (24) I put under the dividual (24) and subtract it therefrom, and the remainder is o, and thus the Work is finished, and I find the quotient to be 364, that is, 6 is contained in 2184 just 364 times, or 2184 being divided into 6 equal parts, 364 is one of

50

thole parts.

Again, If it were required to divide 2646 by 7, or into 7 equal parts, the quotient would be found to be 378, as by the following Operation appeareth,

So if it were required to divide 946 by 8, the quotient will be found to be 118, and 2 remaining after Division is ended. The Work followeth.

whole Numbers. 8) 946 (118

8

66 64 (2)

Many times the dividend cannot exactly be divided by the divifor, but fomething will remain, as in the last Example, where 946 was given to be divided by 8, the quotient was 118, and there remaineth 2 after the Division is ended : Now what is to be done in this cafe with the remainder, the Learner shall be taught when we come to treat of reducing (or Reduction) of Fractions.

And here note, that if after your Division is ended, any thing do remain, it must be leffer than your divifor, for otherwife your Work is not rightly perform d.

Other Examples are such as follow.

8)	73464	(9183	9) 13758 (1528
•	72		Ì9

Division of

Chiap. 7.

5. But if the divifor confifteth of more places than one, then chufe fo many figures from the left fide of the dividend for a dividual as there are figures in the divifor, and put a point under the fartheft figure of that dividual to the right-hand, and feck how often the first figure on the left fide of the divifor, is contained in the first figure on the left fide of the dividual, and place the Answer in the Quotient, and thereby multiply your divifor, placing your product under your dividual, and fubtract it therefrom, placing the remainder below the line t then put a point under the next figure in the dividual, and draw it down to the faid remainder, and annex it on the right fide thereof, which makes a new dividual, and proceed as before, till the Work is finished.

And if it to happen that after you have choice your first dividual (as is before directed) you find it to, be lefter than the divitor, then put a point under a figure more near to the right-hand, and leck how often the first figure on the left fide of the divitor is contained in the two first figures on the left fide of the dividual, and place the answer in the quotient, by which multiply the dividual, and motract it thereform, and proceed as before.

Always remembring, that (in all the cafes of Division) if after you have multiplied your divisor by the figure last placed in the Quotient, the product be greater than the dividual, then you must cancel that figure in the Quotient, and instead thereof put a figure lefter by a Unit, (or one) and multiply the divisor thereby, and if still the product be greater than the dividual, make the figure in the quotient yet lefter by a Unit, and thus do until your product be lefter than the dividual, or at the most equal thereto, and then make Subtraction, Gre.

So if you would divide 9454 by 24, the quotient will be found to be 394; I first put down the given Numbers, as is before directed in the third Rule: Now because

whole Numbers.

becaule my divisor confistent of two Figures, I therefore put a point under the lecond Figure from the left-hand in my dividend, which here is 4, wherefore I feek how often 2 the first figure (on the left fide of the divisor) is contained in 9 (the like first in the

Chap, 7.

dividual) the answer is 4. which I put in the quotient, and thereby multiply all the divisors, and find the product to be 96, which is greater than the dividual 94, wherefore I cancel the 4 in the quotient, and inflead thereof I put 3 (a Unit leffer) and by it multiply the divisor 34, and the product is 72, which I inbtract from 94 the dividual, and the remainder is 22, then do I make a point under the next figure 6 in the dividend, and draw it do m and place it on the right fide of the remainder 22, 24) 9464 (29 -

on the right fide of the remainder 22, and it makes 226 for a new dividual, now because the dividual 226 confifteth of a Figure more than the divifor, therefore I feek how often 2 (the first figure of the divifor is contained in 22, the two first, of the dividual) I fay 9 times, wherefore I put 9 in the quotient, and thereby multiply the

divilor 24, the product (216) I place under the dividual 226, and subtract it from it, and there remaineth 10.

Then I go on and make a point under the next and laft Figure (4) in the dividend, and draw it down to the remainder 10, and it maketh 104, for a new dividual, which is also a figure more than the divisor, and therefore I feek how often two is contained in 10, I anlwer 5 times, but multiplying my divisor by 5, the product is 120, which is greater than the dividual, and therefore I make it but 4, and by it multiply the divisor, and the product is 96, which being placed under, and fubtracted from the dividual, there remaineth 8, and thus the whole Work of this Division is ended, and I find that 9464 being divided by 24,

10

Division of

Chap. 7. or into 24 equal parts, is found to be 394, as was faid before, and the remainder is 8, as your fee in the work following. 24) 9464 (394₀₁

72	
226 216	
104 96	1
(8))

Another Example may be this, let there be required the quotient of 1183653 divided by 385-5 first I dufpole of the numbers in order to their dividing, and because 385) 1183653 (3 118 the three first figures of the dividend is lefler than the di-1155 vifor 3'85, I therefore make a point under the fourth figure, which is 3, and feck how often 3 (the first figure of the divisor) is contained in 11? The Aoswer is 3, which I put in the Quotient, and thereby multiply the divifor 385, and the product is 1155, which I fubtract from the dividual 1188, and there remains 28. Then (as before) I draw down the next figure, which is 6, and 385) 1183653 (30 place it before the remainder 28, fo have I 286 for a new dividua!, and because it hath no more fi-286 gures than the divifor, I feek how often 3 (the first figure in the di-visor) is contained in 2 (the first figure of the dividu-al) and the Answer is 0, for a greater number cannot be contained in a leffer, wherefore I put o in the quo-tient, and thereby (according to the 5th Rule) I fhould multiply my divisor, but if I do the product will be c, Google and

Chap. 7.

ć

whole Numbers.

and o fubtracted from the dividual 286, the remain is the fame ; wherefore I draw down the next figure (5) from 385) 1183653 (the dividend, and put it before the faid remainder 286, to have 1.2865 for a new dividual, and because it confisteth of four placcs, viz. a place more than the divisor, I feek how often a (the first figure of the divisor) is contained in 28 (the two first of the

1124. 2865

2695 (170)

dividual) and Flay there is 9 times 3 in 28, but tiplying my whole divisor (285) theseby I find product to be 2465, which is greater than the dual 2865, wherefore I chufe 8, which is leffer a Unit than 9, and thereby I multiply my di 385, and the product is 3080, which still is gre than the faid dividual, wherefore I chule another 1 ber jet a Unit leffer, viz. 7; and having multip my divisor thereby, the product is 2605, which leffer than the dividual 2805, wherefore I put 7 ir quotient, and subtract 2695 from the dividual 2. and there remains 170; then I draw down the la gure (3) in the dividend, and place it before the

remainder 170, and it makes 1703 for a new dividual; then (for the Reafon abovefuid) I leek how often 3 is contained in 17, the answer is 5, but multi-plying the divisor thereby, the product is (1925) greater than the dividual, wherefore I say it will bear 4 (a Unit leffer) and by it 1 multiply the divisor 285 and the product is 1540, which is leffer than the dividual, and therefore I put 4 in the quo-

tient, and subtract the faid product from the divi and there remaineth 163, and thus the Work is f ed, and I find that 1183653 being divided by Dia ded by Google

Chap. 7.

or into 385 equal shares or parts, the Quotient (or one of those parts) is 3074, and besides there is 163 remaining.

And thus the Learner being well verfed in the Method of the foregoing Examples, he may be fufficiently qualified for the dividing of any greater Sum or Number into as many parts as he pleafeth, that is, he may understand the method of dividing by a divifor, which confisteth of 4, or 5, or 6, or any greater number of places, the Method being the fame with the foregoing Examples in every respect.

Other Examples in Division. 27986) 835684790 (29860

gures that are on the Left-hand, will be the Quotient, and those that are on the Right-hand will be the Remainder after the Division is ended : As thus, if 45783 were to be divided by 10, I cut off the laft figure (3) with a dash thus (4578 3) and the work is done, and the quotient is 4578 (the number on the left-hand of the dash) and the remainder is 3 (on the right-hand ;) in like manner if the fame number 45783 were to be divided by 100, I cut off two figures from the end thus (457 83) and the quotient is 457, and the remainder is 83. And if I were to divide the fame by 1000, I cut off 3 figures from the end thus, (45 783) and the Quotient is 45, and 783 the remainder, Oc.

6. The General Effect of Division is contained in the definition of the fame (that is) by having two unequal numbers given to find a third Number in fuch . proportion to the dividend, as the divifor hath to Unit or I, it also discovers what reason or proportion there is between numbers, fo if you divide 12 by 4, it quotes 3, which thews the reafon or proportion of 4 to 12 is triple.

The fecond effect is by the superficial measure or content, and the length of any Oblong, Rectangular Parellelogram, or square Plane known, to find out the breadth thereby, or contrariwife by having the superficies, and breadth of the faid figure, to find out the length thereof. Alfo by having the folidity and lengthof a folid, to find the superficies of the Bale, & e contra.

The third Effect is, by the Contents, Reafon, Price, Walue, Buying, Selling, Expences, Weges, Exchange, Interest, Profit or Lois of any number of things (be it Money Merchandize, or what elfe) to find out the

Cop-

whole Numbers.

Contents, Realon, Price, Value, Buying, Selling, Expence, Wages, Exchange, Interest, Profit or Lofs, of any one thing of like kind.

Cháp: 7.

The fourth Effect is to aid, to compole, and to make other Rules, but principally the Rule of Proportion, called the Golden Rule, or Rule of Three, and the Reduction of Moneys, Weights, and Measures, of one denomination into another, by it also Fractions are abbreviated by finding a common measurer, unto the Numerator and Denominator, thereby discovering commensurable numbers.

If you divide the value of any certain quantity, by the fame quantity, the quotient difference the rate or value of the Integer, as if 8 yards of Cloth coft 96 finilings; if you divide (96) the value or price of the given quantity, by (8) the fame quantity, the quotient will be 12, which is the price or value of 1 of those yards, (7 è contra.

If you divide the value or price of any unknown quantity, by the value of the Integer, it gives you in the quotient that unknown quantity whole price is thus divided; as if 12 fhillings were the value of a yard, I would know how many yards are worth 96 fhillings: Here if you divide (96) the price or value of the unknown quantity, by (12) the rate of the Integer, or one yard, the quotient will be 8, which is the number of yards worth 96 fhillings.

Some Questions answered by Division may be these following.

Queft. 1. If 22 things coft 66 fuiltings, what will a fuch thing coft? Facit, 3 (hillings; for if you divide 66 by 22, the quotient is 3 for the Answer; 61 if 36 yards of ells of any thing be bought or fold for 108 f. how much fhall 1 yard or ell be bought or fold for ? Facit 3.1. for if you divide 108 l. by 36 yards, the quotient will be 3 l. the price of the integer.

Quef. 2. If the Expence, Charges or Wages of ϕ years amount to 868 4. what is the Expence, Charges or Wages of one year.? East 124 J. for if you divide

Division of

60

868 (the Wages of 7 years) by 7 (the number of years) the quotient will be 124 *l*. for the Answer. See the Work. 7) 868 (124

> 28 (0)

-<u>16</u> 14 28

Queft. 3. If the content of one fuperficial Foot be 144 Inches, and the breadth of a board be 9 Inches, how many inches of that board in length will make fuch a foot ? Facit, 16 inches; for by dividing 144 (the number of fquare inches in a fquare foot) by 9 (the inches in the breadth of the board) the Quotient is 16 for the number of inches in length of that board to make a fuperficial Foot.

,		5	

The Proof of Multiplication and Division.

Multiplication and Division interchangeably prove each other; for if you would prove a Sum in Division, whether the Operation be right or no, multiply

Division of

Chap. 7.

the quotient by the divifor; and if any thing remain after the Division was ended, add it to the product, which product (if your fum was rightly divided) will be equal to the dividend : And contrariwife, if you would prove a fum in Multiplication, divide the product by the multiplyer, and if the Work was rightly performed, the quotient will be equal to the multiplicand. See the Example where the Work is done and undone. Let 7654 be given to be multiplied by 3242, the product will be 24814268, as by the Work appeareth.

7654 3242	
15308 30616 15308 22902	•

24814268

And then if you divide the faid product 24814268 by 3242 the multiplyer, the quotient will be 7654, equal to the given multiplicand.

3242)	24814268 (# 54

. •	1 2968 1 2968	•
	(0)	aby Google

In like mannet (to prove a fum or number in Diwijion) if 24814268 were divided by 3242, the Quotient will be found to be 7654 5 then for proof, if you multiply 7654 the quotient by 3254 the divisor, the product will amount to 24814268, equal to the dividend.

Or you may prove the last, or any other Example in Multiplication thus, viz. divide the product by the multiplicand, and the Quotient will be equal to the multiplier. See the Work.

CHAP. VIII.

Of Reduction.

. R Eduction is that which brings together two or more numbers of different data

c. 13. p.152.

66

to one denomination ; or it ferveth to Hill's Arith. change or alter Numbers, Money, Weight, Measure of Time, from one denomination to another \$ and likewife to abridge

Fractions to their loweft Terms. All which it doth. for precifely, that the first proportion remainetly without the leaft jot of Error or Wrong committed ; to that it belongeth as well to Fractions as Integers, of which in its proper place. Reduction is generally performed either by Multiplication or Division; from whence we may gather, that,

2. Reduction is either defcending or afcending.

3. Reduction descending, is when it is required to reduce a Sum or Number of a greater denomination, into a leffer; which Number, when it is fo reduced, shall be equal in value to the Number first given in the greater denomination; as if it were re-

Wing. Arith. ch. 7. 2, 3, 4.

quired to know how many shiftings, pence or farthings are equal in value to an bundred pounds? or how many ounces are con-

tained in 45 hundred weight ? or how many days, hours or minutes there are in 240 years, Orc. And this kind of Reduction is generally performed by Multiplication. 4. Reduttion alcending, is when it is required to reduce or bring a fum or number of a finaller denomination into a greater, which fhail be equivalent to the-given number; as suppose it were required to find out how many Pence, Shillings or Pounds are equal in value to 43785 Farthings; or how many hundreds

are equal to (or in) 3748 Pounds, Oc. and this kind of Reduction is always performed by Division.

5. When a Sum or Number is given to be reduced into another denomination, you are to confider whe-

ther

Chap. 8.

ther it ought to be refolved by the Rule defcending or alcending, viz. by Multiplication or Division : If it be to be performed by Multiplication, confider how many parts of the depomination into which you' would reduce it, 'are contained in a Unit or Integer of' the given number, and multiply the faid given number v thereby, and the product thereof will be the Answer to the Question. As if the Question were in 38 Pounds, how many Shillings ? Here I 28 confider, that in one Pound are 20 Shillings, 20 and that the number of fhillings in 38 pounds will be 20 times 38, where I multiply 780 38 1. by 20, and that product is 760, and to many shillings are contained in 38 pounds, as in the Margent.

But when there is a denomination, or denominations between the number given, and the number required, you may (if you please) reduce it into the next inferiour denomination, and then into the next lower than that, Oc. until you have brought it into the deno-132 pounds mination required : As for Ex-20 ample. Let'it be demanded in 132' pounds how many farthings ? 2640 shilt. First, I multiply 132 (the num-ber of pounds given) by 20, to bring it into (billings, and it 5280 makes 2040 shillings, then do I multiply the shillings (2640) by 2640 12, to bring them into pence, 31680 pence and it produceth 31680, and fo / many pence are contain'd in 2640 shillings, or 132 pounds; then do 1:6720 farth. I multiply the pence, viz. 31680.

by 4 to bring them into farrhings (because 4 farthings is a penny) and I find the product thereof to be 126720, and so many furthings are equal in value to 132 pounds, the Work is manifest in the Margent.

6. And if the number propounded to be reduced, is to be divided, or wrought by the Rule Afcending,

con-

confider how many of the given numbers are equal to an Unit or Integer, in that denomination to which you would reduce your given number, and make that your divifor, and the given number yout dividend; and the . quotient thence arifing will be the number tought or required : As for Example, Let it be required to reduce 2640 Shillings into Pounds. Here I confi-20) 264 0 (132 der that 20 Shillings are equal to one Pound ; wherefore I divide 2640 (the given Number) by 20, and the Quotient is 132, and fo many Pounds are contained in 2640 Shillings. In Reduction defcending and alcending the Learner is advised to take particular. notice of the Tables delivered in the fecond Chapter of this Book. where he may be informed what

(ó)

Chap. 8.

Multipliers or Divifors to make use of in the reducing of any Number to any other denomination whatfoever, especially English Moneys, Weights, Measures, Time and Motion; but in this place it is not convenient to meddle with Foreign Coins, Weights or Measures.

But if in Reduction alcending it happen that there is a denomination or denominations between the number given, and the number required, then you may reduce your number given into the next superiour denomination, and when is s fo reduced, bring it into the next above that, and to on until you have brought it into the denomination required. As for Example, Let it be demanded in 125720 furthings how many

Pounds ? First, I divide my given number (being far-things) by 4, to bring them into pence (because 4 far-things make one penny) and they are 31680 pence, then I divide 31680 pence by 12, and the Quotient giveth 2640 *fhillings*, and then I divide 2640 *fhillings* by 20, and the quotient giveth 132 pounds, which are equal in value to 125720 farthings. See the whole Work as it followeth. zed by Google

Digitized by Google

Sum 11686 pence

8. If (in Reduction Alcending) after Division is ended, any thing remain, such remainder is of the same denomination with the dividend.

Example. In 4783 farthings, I demand how many pounds.

First, I divide the given number of farthings, (viz. 4783) by 4 to bring them into pence, and the quotient is 1195 pence, and there remaineth 3 after the work of Division is ended, which is 3 farthings. Again, I divide 1195 pence (the faid quotient) by 12,

Again, I divide 1195 pence (the faid quotient) by 12, to reduce them into *fbillings*, and the quotient is 99 *fbillings*, and there is a remainder of 7, which is 7 pence.

And then I divide 99 *(billings* (the laft quotient) by 20, to bring it into pounds, and the quotient is 4 l. and there remaineth 19 *(billings*; fo that I conclude that in 4783 (the propoled number of farthings) there is 4 pounds, 19 *(billings, 7 pence, 3 farthings.)* View the following Operation.

⊕

These various ways of operating are expressed to inform the Judgment of the Learber, with the Reason of the Rule; more ways may be shown, but these are sufficient even for the meanest Capacities.

Quest. 4. In 458 l. 16 s. 7 d. 3 grs. how many furthings? To refolve this Question confider the feventh Rule of this Chapter, and work as you are there dirested, and you will find the aforefaid given number to amount to 440479 farthings, viz.

Chap. 8.

This last Question (or any other of this kind, viz. where the number given to be reduced confisteth of several denominations) may be more concisely refolved thus, viz. when you multiply the pounds by 20, to bring them into *fhillings*, to the product of the first Figure, add the Figure flanding in the place of Units in the denomination of *fhillings*, but because the first figure in the Multiplyer is (0) I fay 0 times 8 is mothing, but 6 is 6, which I put down for the first figure in the product, then because this multiplyer is 0, I go on no further with it, for if I should, the whole product would be 0, but proceed, and when I come to multiply by the fecond figure in the multiplyer, and to the product of it, I add the figure flanding in the place of Tens in the denomination of *(billings* which

is (1) faying 2 times 8 is 16, and (the faid figure) 1 is 17, then I fet down 7, and carry an Unit to the product of the next figure as is directed in the fifth Rule of the fixth Chapter foregoing ; and finish the Work. So that you now have the whole product and fum of Shillings at one Operation, which is the fame as before, and when you multiply the Shillings by 12, to bring them into pence (after the fame manner) add to the product the number flanding in the denomination of pence, and fo when you multiply the pence by 4 to bring them into farthings, add to the product the number standing under the denomination of farthings. See the last Question thus wrought.

	Rem. (6) balf-pend	18 ·

It would have produced the fame Answer if you had reduced your given number into farthings, and divided by the farthings in $13 \ddagger d$. viz. 54, -(for always the Dividend and the Divisor mult be of one denomination) and then you would have had a remainder of 12 farthings, which are equal in value to the former remainder of 6 half-pence, as you may at your leilure.

Queft. 9. In \$40 Dollars at 4 s. 4 d. per Dollar, how many pounds sterling?

First, Bring your given Number of Dollars into pence, and then your pence into pounds according to the former Directions. Thus in 4s. 4d. (viz. a Dollar) you will find 52 pence, by which multiply 540 Dollars, and it produceth 28080 pence, which if you divide by 240 (the pence in one pound) the quotient will give you 117 *l*. which are equal in value to 540 Dollars, at 4s. 4d. per Dollar. Observe the Operation.

> 540 52

1080.

2700 240) 2808 0 (117

P2

\$2 pence

\$40-

The foregoing Queflion might have been otherwife wrought, thus, viz. Multiply (540) your given number of Dollars, by 13 the number of Groats in a Dollar (or 4.5. 4 d.) and it produceth 7020 groats, which divide by 60 (the groats in 1 pound or 20 fhillings) and the quote is 117 l. as before. See the Work.

Remains (18) balf-pence or 9 d.

Quefl. 11. In 4386 l. I demand how many pieces of 6d, of 4d, and of 2d. of each an equal number 7 that is to fay, what number of fix-pences, groats, and two-pences, will make up 4386 l. and the number of each equal?

The way to refolve Queflions of this Nature, is to add the feveral pieces (into which the given Number is to be brought) into one Sum, and to reduce the given number into the fame denomination with their fum, and to divide the faid given number (fo reduced) by the faid Sum, and the Quotient will give you the exact number of each piece. And after the fame Method will we proceed to refolve the prefent Queftion, viz.

84	 `` 	Reduction		Chap. 8.
		pounds pence	6	-
	175440 8172		Sum 12	pence
12)	1052640	(87720	_	• •
•	96 92	· · · ·	·

	84 24	Facit 87720	pieces of 6-	-4-2
	24			•
•	. (0)	· · ·		

So that I conclude by the operation that 87720 fix pences, and 87720 groats, and 87720 two-pences are just as much as (or equal to) 4386 l. or if you admit of 5 s. to be thus divided, it is equal to 5 fix-pences, and 5 four pences or groats, and 5 two-pences. For if two Right Lines (or two Numbers) be given, and one of them be divided into as many Parts, or Segments as you pleafe, the keelangle (or Praudi) comprehendid under the two while right lines (or number) so given) shall be equal to all the Restangles (or Products) contained under the whole line (or number) and the feural Segments (or Parts) into which the other time (or number) is divided. Eucl. 2. 1.

Another Question of the same Nature with the last may be this following, viz.

Quefl. 12. A Merchant is defirous to change 1481. noto pieces of $13 d. \frac{1}{3}$ of 12 d. of 9 d. of 6 d. and of 4 d.; and he will have of each fort an equal number of pieces, I defire to know the number?

Do as you were taught in the 'aft Queftion, via. and the feveral pieces together, and reduce the Sum

it: 148 his reater by t ind the Anfi he pieces r ialf-pence by	to the fame denot he leffer, and it wer, viz. 798 is equired, and 18 y the 8th Rule of	en. the Sum to be chan nination, and divi the Quotient you the Number of e remaineth, which this Chapter. S	de th m wi

Chap. 9-

Note that as Multiplication and Division do interchangeably prove each other, to Reduction defeending and accending, prove each other, by inverting the Queftion, as the 13 and 14, and likewife the 16 and 17 Queftions foregoing, by Inversion, do interchangeably prove each other; the like may be performed for the proof of any Queffion in Reduction whatfo-EVEL.

Thus far have we discoursed concerning fingle Arithmetick, whole Nature and Parts are defined in the fecond, eighth, ninth, and tenth Definitions of the third Chapter of this Book, for although Reduction is not reckoned or defined among the parts of fingle Arithmetick, yet confidered abstractly, it is the proper effect of Multiplication and Division; and as for the extraction of Roots (which ought to be handled in the next place as parts of fingle Arithmetick) we shall omit it in this place, and refer the Learner to Mr. Cockers Decimal Arithmetick, which is (with great care and pains) now published, together with his Logarithme-tical Arithmetick, shewing the Genesis or Fabrick of the Logarithms, and their general ules in Arithmetick, Gr. As also his Algebraical Arithmetick, containing the Doffrine of composing and refolving an Equa-tion, with all other Rules necessary for the understanding of that Mysterious Art, Gc.

CHAP. IX.

Of Comparative Arithmetick; viz. The Re-Intion of Numbers one to another.

Omparative Arithmetick is that which is wrought by Numbers, as they are confidered to have relation one to another, and this confifts either in Quantify, or in Boetine Arith. Ho. 1. cap. 21. Quality. Digitized by GOOg[e 3: RC-

ļ

of Numbers.

2. Relation of Numbers in quantity, is the reference or respect that the Numbers themselves have one to another, where the Vide Wing. A-Terms or Numbers propounded are al- rith. cap. 34ways two, the first called the Ante. cedent, and the other the Confequent.

2. The relation of Numbers and Quantity confifts in the differences, or in the rate or reason that is found , betwixt the Terms propounded, the difference of two Numbers being the remainder found by Subtraction, but the rate of reason is Alfled, Mathebetwixt two numbers is the quotient mat, lib. 2. cap. of the Antecedent divided by the Con-11. 07 12. fequent. So 21 and 7 being given, the

difference betwixt them will be found to be 14, but the rate or reason that is betwixt 21 and 7 will be found to be triple reason, for 21 divided by 7 quotes 2, the reafon or rate.

4. The relation of Numbers is Quality, (otherwise called Proportion) is the reference or refpect that the reason of Numbers have one unto another; therefore the Terms given, ought to be more

than two. Now this proportion or Alfred. Mathereafon between Numbers relating one mat. lib.2. cap. to another, is either Arithmetical, or 21." Geometrical.

5. Arithmetical Proportion (by fome called Progreffion) is when divers Numbers differ one from another by equal Reafon, that is, have equal differences.

So this rank of Numbers 3, 5, 7, 9, 11, 13, 15, 17, differ by equal Reafon ; viz. by 2, as you may prove.

6. In a rank of Numbers that differ by Arithmetical Proportion, the fum of the first and last Term being multiplied by half the number of Terms, the product is the total fum of all the Terms.

Or if you multiply the number of the Terms by the half fum of the first and last Terms, the product thereof will be the total fum of all the Terms.

So in the former Progression given, 3 and 17 is 20, which multiplied by 4 (viz. half the sumber of Terms) Google the

F .

Chap. 9.

the product gives 80, the fum of all the Terms ; or multiply 8 (the Number of Terms) by 10 (half the fum of the first and last Terms) the product gives 80 as before.

So alfo 21, 18, 15, 12, 9, 6, 3, being given, the fum of all the Terms will be found to be 84; for here the number of Terms is 7, and the fum of the first and left (viz. 21 and 3) is 24, half whereof (viz. 12) multiplied by 7 produceth 84, the fum of the Terms fought.

7. Three Numbers that differ by Arithmetical Proportion, the double of the mean (or middle number) is coual to the lum of the Extreams.

So 9, 12, and 15 being given, the double of the mean 12 (viz. 24) is equal to the fum of the Extreams o and 15.

8. Four Numbers that differ by Arithmetical Frcportion (either continued or interrupted) the fum of the two Means is equal to the fum of the two Extreams."

So 9, 12, 18, 21, being given, the fum of 12 and 18 will be equal to the Vide Wing. Arith. cap. 35. fum of 9 and 21, viz. 30; alfo 6, 8, 14, 16 being given, the fum of 8 and

14 is equal to the fum of 6 and 16, viz. 22, fr.

9. Geometrical Proportion (by fome called Geometrical Progression) is when divers' numbers differ according to like Reafon.

So 1, 2, 4, 8, 16, 32, 64, Oc. differ by double Reason, and 3, 9, 27, 81, 243, 729, differ by triple Reason; 4, 16, 64, 256, 676, differ by quadruple Reafon, Or.

io. In any numbers that increase by Geometrical Proportion, if you multiply the laft Term by the Quotient of any one of the Terms divided by another of the Terms, which being lefs is next unto it, and having deducted, or subtracted, the first Term out of that product, divide the remainder by a number that is an Unit lefs than the faid Quotient, the laft quote will give the fum of all the Terms.

1458

` 2

2) :456 (728

Alto

4096

So, 1, 2, 4, 8, 16, 32, 64, being 4) 8 (2 given, first I take one of the Terms, viz. 8, and divide it by the Term which is lefs and next to it, (viz. 128 by 4) and the Quotient is 2, by which I multiply the last Term 64, and the product is 128, from whence 1) 127 (127 I fubtract the first Term, (viz. 1) the remainder is 127, which divided by the Quotient 2 made lefs by 1 (viz, 1) the quote is 127, for the fum of all the given Terms, as by the Work in the Margent.

So if 4, 16, 64, 256, 1024 were given, the fum of all the Terms will be found to be 1354. For first, I divide 64, one of the Terms, by his next leffer Term, 16) 64 (4 and the Quotient is 4, by which I multiply the last Term 1024; and it produceth 4096; from whence I fubtract the first Term 4, and theremainder is 4092, which I divide 3) 4092 (1364 by the quote less 1 (viz 3) and the quote is 1364, for the total fum of all the Terms, 'as per Margent.

So likewise if 2, 6, 18, 54, 162, 486 were given, the fum or total of all the Ferms will be found to be 728. See the Work.

115 Three Geometrical Proportionals given, the Square of the Mean is equal to the Rectangle, or Product of the Extreams,

So 8, 16, 32, being given, the Square of the Mean. viz: 16 is 256, which is equal to-the product of the Extreams 8 and 32, for 8 times 32 is equal to 255.

12. Of 4 Geometrical Proportional numbers given. the product of the two Means is equal to the product of the two Extreams.

So 8, 16, 32, 64, being given, I fay that the product of the two Means, vie. 16 times 32, which is 512, is equal to 8 times 64, the product of the Extreams.

Ine imple kule

192 '

Alfo if 3, 9, 21, 63, were given (which are interrupted) I lay 9 times 21 is equal to 3 times 63, which is equal to 189.

From hence arifeth that precious Gem in Arithmetick, which for the Excellency thereof is called the Golden Rule, or Rule of Three.

СНАР. Х.

The Single Rule of Three Direct.

1. T HE Rule of Three (not undefervedly call'd the Golden Rule) is, that by which we find out a fourth number, in proportion unto three given Numbers, to as this fourth Number fought may bear the fame Rate, Reason, or Proportion to the third (given) number, as this fecond doth to the first, from whence it is also called the Rule of Proportion.

²2. Four Numbers are faid to be Proportional, when the first containeth or is contained by the second, as often as the third containeth or is contained by the fourth. Vide Wingate's Arith Chap. 8. Sellig.

So these Numbers are faid to be Proportionals, viz. 3, 6, 9, 18, for as often as the first Number is contained in the second, so often is the third contained in the fourth, viz. twice. Also 9, 3, 15, 5, are faid to be proportional, for as often as the first Number containeth the second, so often the third Number containeth the second, so often the third Number containeth the fourth; viz. 3 times.

3. The Rule of Three is either fimple or compoled.

4. The fimple (or fingle) Rule of Three, confifteth of 4 Numbers; that is to fay, it hath 3 Numbers given to find out a fourth; and this is either Direct, or Inverfe. Vide Alfied. Math. lib. 2. cap. 13.

verse. Vide Alfted. Math. lib. 2. cap. 13. 5. The fingle Rule of Three Direct, is when the proportion of the first Term is to the second, as the third is to the fourth; or when it is required that the Number fought

igitized by Google

of Three Direct.

Chap. 10.,

27.

R'S

2, E

n's

34

2 1 1

fought (viz.) the fourth Number must have the fame proportion to the fecond, as the third hath to the first. 6. In the Rule of Three, the greatest difficulty is (after the Question is prapounded) to different the order of the 3 Terms, viz, which is the first, which is the fecond, and which the third, which that you may understand, observe, That (of the three given numbers) two are always of one kind, and the other is of the fame kind with the proportional number that is fought 5 as in this Queltion, viz. If 4 yards of Cloth coff 12 Inillings, what will & yards coft at that rate? Here the two numbers of one kind are 4 and 6, viz. they both fignifie for many yards; and 12 fhillings is the fame kind with the number fought, for the price of 6 yards. is fought.

Again, observe, that of the 3 given numbers, those two that are of the fime kind, one of them mult be the first and the other the third, and that which is of the fame kind with the number fought, must be the fecond number in the Rule of Three ; and that you may know which of the faid numbers to make your first, and which your third, know this, that to one of thole two . numbers there is always affixed a demand, and that number upon which the demand lieth must always be reckoned the third number. As in the forementioned Queffion, the demand is affixed to the number 6, for it is demanded what 6 yards will coft ? and therefore 6. must be the third number, and 4 (which is of the fame denomination (or kind) with it) must be the first, and confequently the number 12 must be the fecond, and then the numbers being placed in the forementioned order, will stand as followeth, viz.

yards

7. In the Rule of Three Dired (having placed the mumbers, as is before directed) the next thing to be done will be to find out the fourth number in proportion, which (that you may do), multiply the fecond number by Fig. Google

2. .

104

by the third, and divide the product thereof by the first, (or which is all one) multiply the third term (or number) by the fecond, and divide the product thereof by the first, and the Quotient thence arising is the 4th number in a direct proportion, and is the number fought, or Answer to the question, and is of the fame demomination that the fecond number is of. As thus, let the fame Question be again repeated, viz. If 4 yards of Cloth cost 12 Shillings, what will 6 yards cost ?

104

Having placed my numbers according to the fixth Rule (of this Chapter) foregoing, I multiply (the fecond number) to by (the third number) 6, and the product is 72, which product I divide by (the first number) 4, and the quotient thence arifing is 18, which is the fourth proportional or number fought, wire 18 shillings, (because the fecond number is shillings) which is the price of the 6 yards, as was required by the quefion. See the Work following :

4) 72 (18 fbillings

s,

yds

(°) Quest. 2: Another Question may be this, viz. If 7 C. of Pepper colt 21 l. how much will 16 C. colt at that rate?

22

To refolve which queftion, I confider that (according to the 6th Rule of this Chapter) the terms or numbers ought to be placed thus, viz. the Demand lying upon 16 C. it must be the third number, and that of the fame kind with it must be the first, viz. 7 C. and 21 l. (being of the fame kind with the number fought) must be the fecond number in this queftion 3 then I proceed

Distinged by GOOACCORDING

Chap. 10. of Three Direct.

according to this 7th Rule, and multiply the fecond number or the third, viz. 21 by 16, and the product is 336, which I divide by the first number 7, and the quotient is 48 *l*. which is the value of 16 *C*. of Pepper at the rate of 21 *l*. for 7 *C*. See the Work following.

lowing. Queft. 3. If 13 yards of Velvet (or any other thing) colt 21 L. what will 27 yards of the fame colt at that rate ?

Having ordered and wrought my numbers according to the 6 and 7 Rules of this Chapter, I find the Quotient to be 43 l. and there is a remainder of 8, fo that I conclude the price of 27 yards to be more than 43 l. and to the intent that I may know how much more, I work according to the foregoing Rule, viz. I multiply the faid Remainder 8 by 20's. (becaule the fecond number in the Queftion was Pounds) and the product is 160, which divided by the first number, viz. 13, it quotes 12, which are 12 fhillings, and there is yet a remainder of 4, which I multiply by 12 pence, (because the last quotient was shillings) and the product is 48, which I divide by 13 (the first number) and the quotient is 3*d*. and yet there remaineth 9, which I multiply by 4 Farthings, and the product is 36, which divided by 13 again, it quotes a Farthings, and there is yet a remainder of 10, which because it cometh not to the value of a Fatthing) may be neglected, or rather fet (after the 2 Farthings) over the divifor, with a Line between them, and then (by the 21 and 22 Definitions of the first Chapter of this Book) it will be $\frac{1}{2}$ of a Farthing; fo that I conclude, that if 13 yards of Velyet cost 21 l. 27 yards of the fame will cost 43 l. 12 s. og d. 24 grs, which Fraction is 10 thirteenths of a Farthing. See the Operation as followeth.

100

Work according to the laft Rule, and you will find it to amount to 921 s. 10 d. 1_{3} grs. and by the sth .

Chap. 10. of Three Direct.

9. In the Rule of Three it many times happeaeth, that although the first and third numbers be Homogeneal (that is, of one kind) as both Money, Weight, Measure, Grc. yet they may not be of one denomination, or perhaps they may both confiss of many denominations, in which case you are to reduce both numbers to one denomination; and likewise your second number (if it confistent (at any time) of divers denominations) must be reduced to the least name mentioned, or lower if you please, which being done, multiply the second and third together, and divide by the first, as is directed in the 7th Rule of this Chapter.

And note that always the Answer to the Queffion is in the same denomination that your second number is of, or is reduced to, as was hinted before.

Quest. 5. If 15 Ounces of Silver be worth 3 l. 15 s. what are 86 Ounces worth at that rate?

In this Queftion the numbers being ordered according to the 6th Rule of this Chapter, the first and third numbers are ounces, and the second number is of divers denominations, viz. 3 l. 15 s. which must be reduced to shillings, and the shillings multiplied by the third number, and the product divided by the first, gives you the answer in shillings, viz. 430 shillings, which are reduced to 21 l. 10 s. See the Work.

FACH 66 56 L

By

By this time the Cearner is (I fuppole) well exercifed in the Practick and Theorick of the Rule of Three Direct, but at his leifure he may look over the following Queffions, whole Answers are given, but the operation purpolely omitted as a Touchflone for the Learner, thereby to try his Ability in what hath been Idelivered in the former Rules.

Queft. 16. If 24 l. of Raifins coft 6 s. 6 d. what will 18 Frails coft, each weighing Neat 3 qrs 18 l. Auswer, 24 l. 17 s. 3 d.

Quest. 19. If an Quece of Silver be worth 5 thillings, what is the price of 14 Ingots, each Ingot weighing 7 l. 5 02. 10 p.m. Answer, 313 l. 5 s.

Quest. 18. If a piece of Cloth doft 10 l. 16 s. 8 d. I demand how many Ells English there are in the Iamo, when the Ell at that rate is worth 8 s. 4 d. ? Answer, 26 Ells English.

Quell. 19. A Factor bought 84 pieces of Stuffs, which coft him in all \$37 L 12 s. at 5 :: 4 d. per yd. I demand how many Yards there were in all, and how many Ells English were contained in a piece of the fame? Answer, 2016 Yards in all, and $19\frac{1}{5}$ Ells-English per piece.

27 Quest. 20. A Draper bought 212 Yards of Broadcloth, which cold thim in all 2541. 103. for 86 yards, of which he gave after the rate of 21 s. 4 d. per yards. I demand how many he gave per yard for the remainder? Answer, 203. 10 d. 754 per yard.

Quell. 21. A Factor bought a certain quantity of Serge and Shalloon, which together collimin 225 l. 14 s. 50 d. thel quantity of Serge he bought was 48 yards, at 3 s. 4 d. per yard; and for every two yards of Serge he had 5 yards of Shalloon, -1 demand how many yards of Shalloon he had, and how much the Shalloon coll him per yard? Answer, 120 yards of Shalloon at 11 l. 56 s. 5752 d. per yard.

Queft. 22. An Oyl-man bought 3 Tun of Oyl, which coft him 151 l. 14 s. and it fo chanced that it leaked out 8 gallons, but he is minded to fell it egain, fo as that he may be no lofer by it, I demand how he The fingle Rule

120

Chap. 10

must sell it per gallon ? Answer, at 4.5. 6274 d. m gallon.

Quefl. 23. Bought 6 packs of Cloth, each pack containing 12 Cloths, which at 8 s. 4 d. per Ell Flemifu colt Loso I. I demand how many yards there were in each Cloth? Anfarer, 27 yards in each Cloth. Quefl. 23. A Gentleman hath 536 I. per annum, and

Quef. 24. A Gentleman hath 536 L per annum, and his Expences are one day with another 18 s. 10 d. 3 qrs. 1 define to know how much he layeth up at the years end? Answer, 191 L 3s. 0d. 1 qr.

Quefl. 25. A Gentleman expendeth daily one day with another 27 s. 10¹ d. and at the years end layeth up 340 l. I demand how much is his Yearly Income ? Anfmer, 848 l. 14 s. 4 f. Quefl. 26. If I fell 14 yards for 10 l. 10 s. cod.

Quest, 26. If I fell 14 yards for 10 l. 10 s. cod. how many Elis Flemish thall I fell for 283 l. 17 s. 6 d. at that rate? Answer, 5043 Elis Flemish. Quest. 27. If 100 l. in 12 Months gain 6 l. Inte-

Queft. 27. If 100 l. in 12 Months gain 6 l. Intereft, how much will 75 l. gain in the fame time, and at the fame rate? Answer, 4 l. 10 s.

Quest. 28. If 100 1. in 12 Months gain 6 1. Intereft, how much will it gain in 7 Months at that rate? Answer, 3 1. to 5. Quest. 29. A certain Usiner put out 75 1. for 12

Quefl. 29, A certain Unrer put out 75% for 12 Months, and received Principal and Interest 81%. I demand what rate per Cent. he received Interest? Aujustre, 8 1. per Cent.

Queff. 30. A Grocer bought 2 Chefts of Sugar, the one weighed neat 17 C. 3 grs 14 l. at 2 l. 6 s. 8 d. per C. the other weighed neat 18 C. 1 gr 21 l. at $4\frac{1}{2}$ d. per l. which he mingleth together, now 1 define to know how much a C. weight of this mixture is worth ? Anjwer, 2 l. 4 s. 3 d. $2\frac{1}{2}\frac{27}{3}$ grs.

Quest. 31. Two Men, viz. A and B, departed both from one place, the one goes East, and the other West, the one travelleth 4 miles a day, the other 5 miles a day, how far are they distant the 9th day after their departure? Answer, 81 Miles.

Quest.

300gle

Queff. 22. A flying every day 40 miles is purfued the 4th day after by B, polting 50 miles a day, now the Queftion is in More's Arithm. how many days, and after how many Chap. 7. Ex.35. miles Pravel will A be overtaken ?

Answer, B overtakes him in 12 days, when they have travelled 600 miles.

11. The general Effect of the Rule of Three Direct, is contained in the definition of the fame, that is, to find a fourth Number in proportion confilling of two equal Reafons as both been fully flown in all the foregoing Examples.

The fecond Effect is, by the price or value of one thing to find the price or value of many things of like kind.

The third Effect is, by the price or value of many things to find the price of one, or by the price of many things (the faid price being 1) to find the price of many things of like kind.

The fourth Effect is, by the price or value of many things, to find the price or value of many things of like kind.

The fifth Effect is, thereby to reduce any Number of Moneys, Weight, or Mealure, the one fort into the other, as in the Rules of Reduction contained in the Eighth Chapter foregoing. Examples of its various Effects have been already answered.

12. The Rule of 3 Direct is thus proved, viz. main tiply the first Number by the fourth, and note the Product, then multiply The Proof of the the second Number by the third, and Rule of Three if this product is equal to the product Direct. of the first and fourth, then the work is rightly performed, otherwise it is erronious

So the first Question of this Chapter (whole Anfiwer or fourth number we found to be 18 s.) is thes proved, viz. the first number is 4, which multiplied by 18 (the fourth) produceth 72. And the fecond and third numbers are 12 and 6, which multiplied together produce 72, equal to the product of the first and fourth, and therefore I conclude the work to be rightly performed. $G \oplus A'$

121

Always observing, that if any thing remain after yow have divided the product of the second and third numbers by the arst, such remainder in proving the same, must be added to the product of the first and fourth Numbers, whole Sum will be equal to the Product of the second and third, (the second number being of the same denomination with the fourth, and the first of the fame denomination with the third.)

The tank denominantly with the time this, Chapter, being again repeated, viz, If 144 of Tobacco cole 27 swhat will 4781 coft at that rate? The Anfwer (or fourth number) was 46.1. of s. 10d. 1 gr. $\frac{1}{2}$, which is thus proved, viz. bring the fourth number into farthings, and it makes 44249, which coultiplied, by the first number 14, produceth 619488 (the second which remaineth being added thereto) then (becaule I reduce my fourth number into farthings,) I reduce my fecond (viz. 27 s.) into farthings, and they are 1296, which multiplied by the third number 478, their product is 619488 equal to the product of the first and fourth Numbers. Wherefore I conclude the Operation to be true. This is an infallible way to prove the Rule of Three Direct, and it is deduced from the 12th Section of the 9th Chapter of this Book.

Thus much concerning The Single Rule of Three Direll, and I queftion not but by this time the Learner is fufficiently qualified to refolve any Queftion pertinent to this Rule, not relying upon Frallions, or Geometrical Magnitudes. Those that are defirous to see the Demonstration of this Rule, let them read the fixth Chapter of (the ingenious) Mr. Kerfey's Appendix to Wingate's Arithmetick. Or the fixth Chapter of Mr. Oughtred's (incomparable) Clavia Mathematica : By both which Authors this Rule is largely demonstrated, being grounded upon the 19th Prop. of the 7th, and the 19th Prop. of the 9th of Euclid. Elem.

CHAP.

Chapitr.

CHAP. XI.

The Single Rule of Three Inverse.

1. THE Golden Rule, or Rule of 3 Inverse, is when there are 3 Numbers given to find a fourth, in fuch proportion to the 3 given numbers, so as the 4th proceeds from the second, according to the fame Rate, Reason, or Proportion that the first proceeds from the third, or the Proportion is.

As the third Number is in propor- Alfted. Math.tion to the fecond, to is the first to the lib. 2. cap. 14. fourth.

So if the 3 numbers given were 8, 12, and 16, and it were required to find a fourth number in an inverted proportion to thele, I fay, that as 16 (the third number) is the double of the first Term or number (8) fo must 12 (the second number) be the double of the fourth; to will you find the fourth term or number to be 6. And as in the *Rule of 3 Direa*, you multiply the second and third together, and divide their Product for a fourth proportional number.

2. In the *Rule of 3 Inver/e*, you muft multiply the fecond term by the first (or first term by the fecond), and divide the Product thereof by the third term, fo the , quotient will give you the 4th term fought in an Inverted Proportion. The fame order being observ'd in this Rule, as in the *Rule of 3 Direst*, for placing and dispofing of the given numbers, and after your numbers are placed in order, that you may know whether your Question be to be refolved by the *Rule Direst* or *Inver/e*, observe the general Rule following.

3. When your Queftion is flated, and your numbers orderly difpoled, confider in the first place whether the fourth term or number fought, ought to be more or lefs than the fecond term; which you may eafly do: And if it is required to be more, or greater than the fecond term, then the lefter Extream must be your Divifor; but if it require lefs, then the biggest Ex-

tream

The single Rule

124

. Chap. II.

tream mult be your Divisor (in this Cale the first and third numbers are called Entreame in respect of the second) and having found out your Divisor, you may know whether your question belongs to the Rule Direct or inverse; for if the third term be your Divisor, then it is Inverse; but if the first term be your Divisor, then it is a Direct Rule. As in the following Questions.

Quest. 1. If & Labourers can do a certain piece of work in 12 days, in how many days will 16 Labourers do the fame ? Answer, in 6 days.

Having placed the numbers according to the 6th Rule of the 10th Chapter, I confider that if 8 Men can finish the Jab. days Jab. Work in 12 days, 16 men will 8-----12do it in leffer (or fewer days, 8 than 12,) therefore the biggeft Extream muft be the Divifor. 16) 96 (6 days which is 16, and therefore it is the 96 Rule of 3 Inverse, wherefore I multiply the first and second numbers (0) Facit 6 days. together, viz. 8 by 12, and their product is 96, which divided by

(16, quotes 6 days for the Animer, and in fo many days will 16 Labourers perform a piece of work, when 8 can do it in 12 days.

Queft. 2. We when the measure (vixis peck) of Wheat cost 2 shillings, the penny Loas weighed (according to the Standard, Statute, or Law of England) 8 Ounces, I demand how much it will weigh when the peck is worth 1 s. 6 d. according to the same rate or proportion? Answer, 10 st. 13 p.w. 8 gr.

Having placed and reduced the given numbers according to the 6 and 9 Rules of the 10th Chapter, I confider, that at 1 s. 6 d. per peck; the penny Loaf will weigh more than at 2 s. per peck; for as the price decreafeth, the weight increafeth, and as the price increafeth, to the weight diminifheth, wherefore becaufe the first term requireth more than the second, the lefter Textream mult be the Divilor, 1 s. 6 d. or 18 d. and having finished the work, I find the Answer to be 10 sz.

Quell. 3. How many pieces of Money or Merchandife at 20.5. per piece are to be given or seceived for 240 pieces, the value or price of every piece being 12 fhillings? Anfwer, 144. For if 125. require 240 pieces, then 20 fhillings will require lefs; therefore the biggeft Extream must be the Divisor, which is the third. number, Gr. See the Work.

(0) Quell 4. How many yards of 3 quarters broad are required to double, or be equal in measure to 30 yards, that are 5 quarters broad ? Answer, 50 For fay, If & quarters yards : wide require 30 yards long, what length will three quarters foroid require ? Here I confider - that three quarters broad will require more yards than 30, for . the narrower the Cloth is, the more in length will go to make equal measure with a broader piece.

Quest. 5. At the Request of a Friend I lent him 200 1. for 12 months, promiting to do me the like Courtefie at my Necessity ; but when I came to requeft it of him, he could let me have but. 1 50 L. now I defire to know how long I may keep this Money to make plenary fatisfaction for my former kindnels to my Friend? Answer, 16 months, I fay, If 2001. require 12 months, what will 150 L require ? 150 L will require more time than 12 months, therefore the leffer Extream (viz. 150) must be the Divisor, multiply

~5 30 3) 150 (50 yds 15 (0)

iby Google

-long-

of Three Inverse.

Chap. I.I. ply and divide, and you will find the fourth inverted Proportional to be 16, and fo many months I ought to keep the 1 50 l. for latisfaction.

Queft. 6. If for 24's, I have 1200 l. weight carried 26 miles, how many miles thall 1800 L be carried for the fame Money ? Anfwer, 24 miles.

Quest: 4. If for 24 s. I have 1200 l. carried 36 miles, how many pound weight shall I have carried. 24 miles for the fame Money ? Anfwer, 1800 pound weight.

Queft. 8. If 100 Workmen in 12 days finish a piece. of work or fervice, how many Workmen are fufficient to do the fame in 2 days ? Anfwer, 400 Workmen.

Quest. 9. A Colonel is befieged in a Town in which are 1000 Soldiers, with provision of Victuals only for 3 months, the queffion is, how many of his Soldiers must he difmils, that his Victuals may last the remaining Soldiers & months? Answer, 500 he must keep, and difmifs as many.

Quest. 10. If Wine worth 20 1, is fufficient for the Ordinary of '100 Men, when the Tun is fold for 20 L how many Men will the fame 20 pounds worth fuffice when the Tun is worth 24 l. Anfwer, 125 Men.

Queft. 11. How much Plush is sufficient to line a Cloak, which hath in it 4 yards of 7 quarters wide, when the Plush is but' 3 quarters wide ? Answer, 97 vards of "Plufh.

Queft. 12. How many yards of Canvas that is Ell wide, will be fufficient to line 20 yards of Say, that is 2 quarters wide ? Anfwer, 12.yards.

Quefl. 13. How many yards of Matting that is two foot wide, will cover a Floor that is 24 foot long, and 20 foot broad ? Answer, 240 foot.

Quest. 14. A Regiment of Soldiers' confisting of 1000, are to have new Coats, and each Coat to contain 2 yards, 2 quarters of Cloth, that is & quarters wide, and they are to be lined with Shalloon that is -3 quarters wide, I demand how many yards of Shalloon will line them ? Answer, 166663 quarters of yards, or 4186? yards. G·4, Google, Queft.

127

Queff. 19. A Meffenger makes a Journey in 24 days, when the day is 12 hours long, I defire to know in how many days he will go the fame when the days is 16 hours long? Anfmer, in 18 days. Queft. 16. Borrowed of my Friend 64 1. for 8

Quefl. 16. Borrowed of my Friend 64 l. for 8 snonths, and he hath occasion another time for to borrow of me for 12 months, I defire to know how much 1 muft lend to make good his former kindness to me ? Auswer, 42 l. 13 s. 4 d.

4. The general Effect of the Rule of 3 Inverse is contained in the definition of the same, that is, to find a tourth term in a Reciprocal Proportion, inversed to the Proportion given.

The fecond Effect, is by two prices, or values of two feveral pieces of Money or Merchandize known, to find how many pieces of the one price is to be given for fo many of the other. And confequently to reduce and exchange one fort of Money, or Merchandize into another. Or contrariwise to find the price unknown of any piece given to exchange in Reciprocal Proportion.

The third Effect, is, by two differing prices of a measure of Wheat bought or fold, and the weight of the Leaf of Bread, made aniwerable to one of the prices of the measure given, to find out the weightof the fame Loaf aniwerable to the other price of the faid measure given. Or contrariwife by the two feveral weights of the fame prized Loaf, and the price of the measure of Wheat answerable to one of those Weights given, to find out the other price of the measure answerable to the other price of the measure answerable to the other weight of the fame Loaf.

The fourth Effect, is, by two lengths, and one breadth of two Rectangular Planes known to find our another breadth unknown. Or by two breadths and one length given, to find out another length unknown in an inverted proportion.

The fifth Effect, is, by double time and a capital fum of money borrowed or lent, to find out another eapital fum answerable to one of the given Times or of Three Inverse.

Chap. 11.

1200

-, or otherwife, by two capital fums, and a time ablwer able to one of them given to find out a time answerable to the other capital fum in Reciprocal Reason.

able to the other capital fum in Reciprocal Reafon. The fixth Effect, is, by two differing weights of Carriage, and the diffance of the places in Miles or in Leagues given, to find another diffance in Miles anfwerable to the fame price of payment: Or otherwife by two diffances in Miles, and the weight anfwerable to one of the diffances (being carried for a certain price) to find out the weight anfwerable to the other diffance for the fame price.

The feventh Effect, is, by double Workmen, and the time answerable to one of the numbers of Workmen given, to find out the time answerable to the other number of Workmen, in the performance of any work or fervice. Or contrariwile, by double time and the workmen answerable to one of those times given, to find out the number of workmen answerable to the other time, in the performance of any work or fervice.

Allo by a double price of Provision, and the number of Men, or other Creatures nourished for a tertain time, answerable to one of the prices of Provision given, to find out another number of Men or other Greatures answerable to the other, price of the provifion for the same time. Or contrariwife by two numbers of Men or other Creatures nourished, and one price of Provision answerable to one of the numbers of Creatures given, to find out the other, price of the fame Provision answerable to the other number of Creatures, both being supposed to be nourished for the same, or the foregoing Examples is fully declared.

To prove the Operation of the Rule of 3 Inverse, multiply the third and fourth terms together, and note their product; and multiply the first and second together, and if their product is equal to the product of third and fourth, then is the work truly wrought, but if it falleth out otherwise, then it is erroneous.

As in the first Question of this Chapter, 16 (the third number) being multiplied by 6 (the Furth number)

Gκ

the product is 96, and the product of 8 (the first number) multiplied by 12 (the fecond number) is 96, equal to the first product, which proves the work to be right.

And Note, that if in Division any thing remain, fuch remainder must be added to the product of the third and fourth terms, and if the Sum be equal to the product of the first and second (the homogeneal terms being of one denomination) the work is right.

CHAP. XII.

The Double Rule of Three Direct.

W? E have already delivered the Rules of Single Proportion, and we come now to lay down the Rules of Plural Proportion.

1. Plural Proportion, is when more Operations in the Rule of Three than one, are required before a Solution can be given to the Queflion propounded. Therefore in Queflions that require Plurality in Proportion, there are always given more than 3 Numbers.

2. When there are given 5 numbers; and a fixth is required in proportion thereunto, then this fixth proportion is faid to be found out by the double Rule of Three, as in the Queffion following, viz.

If 100 k in 12 Months gain 6 k. Intereft, how much will 75 k gain in 9 months?

2. Queflions in the double Rule of Three may be refolved either by two fingle Rules of Three, or by one fingle Rule of Three, compounded of the five given Numbers.

4. The double Rule of Three is either Direct, or elle Inverse.

5. The double Rule of Three Direll, is, when unto 5 given numbers, a fixth propertional may be found out by two fingle Rules of Three Direll.

- The five given Numbers in the double Rule of Three

Chap. 12,

Three confift of 2 parts, viz. First, a Supposition, and Secondly, of a Demand; the Supposition is contained in the three first of the five given Numbers, and the Demand lies in the two last; as in the Example of the fecond Rule of this Chapter, viz. If 100 l. in 12 months gain 6 l. Interest, what will 75 l. gain in 9 months? Here the Supposition is expressed in 100, 12, and 6; for it is faid, if (or fuppose) 100 l. in 12 months gain 6 l. Interest, and the Demand lyeth in 75 and 9; for it is demanded how much 75 l. will gain in 9 months?

7. When your Queffion is flated, the next thing will be to dispose of the given Numbers in due order. and place, as a preparative for Refolution ; which that you may do, First, observe which of the given Numbers in the Supposition is of the fame Denomination with the Number required, for that must be the fecond number (in the first operation) of the fingle Rule of 3, and one of the other Numbers in the Supposition (it matters not which) must be the first Number, and that Number in the Demand which is of the fame Denomination with the firft, muft be the third number, which' three Numbers being thus placed, will make one perfect Queftion in the fingle Rule of Three, as in the ! forementioned Example : First, I consider that the Number required in the Question is the Interest or Gain of 75 l. therefore that number in the Supposition which hath the fame name (viz. 6 l. which is the In-, tereft or Gain of 100 L) must be the: fecond Number in the first Operation, 100-6-75 and either 100 or '12' (it matters not ... which) must be the first Number ; but I will take 100, and then for the third Number, I put that Number in the Demand which hath the fame Denomina-

tion with 1co, which is 75, (for they both fignific pounds principal) and then the Numbers will fiand any you fee in the Margent.

, Digitized by Google

Bata

131

The double Rule

¥32

But if I had for the first number put the other number in the Supposition, viz. 12, which fignifieth 12 months, then the third number must kave been 9, which is that number 12-3-9 in the Demand which hath the fame Denomination with the first, viz. 9 months, and then they will fland as in the Margent.

There yet remain two numbers to be disposed of, and those are, one in the Supposition, and another in the Demand ; that 100which is of the Supposition I place . 12 under the first of the three numvers, and the other which is in the Or thin, Demand I place under the third number, and then 2 of the terms in 12 the Supposition will ftand (one 100 over the other) in the first place, and the g terms in the Demand will fland (one over the other) in the third place, as in the Margent.

8. Having difposed, or ordered the numbers given according to the laft Rule, we may proceed to a refo-Jution, and first I work with the three appermost numbers, which according to the first disposition are ioo, 6, and 79, which is as much as to fay, If 100 /. Fequice 6 L (Intereft) how much will 75 1. require ? which by the third Rule of the eleventh Chapter I find to be Direll, and by the 7th and 8th Rules of the toth Chapter, I find the fourth Propertional Number to be 41. 10 s. fo that by the foregoing fingle Queftion I have discovered how much Interest-75 I. will gain in 12 months, the operation whereof followeth on the left hand under the letter A; and having discovered how much 75 l. will gain in 12 months, we may by another queffion cafily difcover how much it will gain in 9 months, for this fourth number (thus found) I put in the middle between the two lowest numbers of the five, after they are placed according to the feventh Rule of this Chapter ; and then it will be a fecond number, in another Queflion in the Rule of Three, m. The double Rule

Chap. 12.

So that, by the foregoing Operation I conclude that if 100 l in 12 months gain 6 l. Intereft, 75 l, will gain 3 l. 75. 6 d. in 9 months after the fame fate,

The Answer would have been the fame if the s given numbers had been ordered 12....5...9 according to the second method, wit. 25 100 75 you see in the Margent.

For first, I fay, If 12 months gain 61. what will 9 months gain 2 This Question I find to be Direst by the 3d Rule of the 11th Chapter, and by the 7th and 8th Rules of the roth Chapter, I find the fourth proportional Number to these three to be 41. 10 s.

Thus have I found out what is the Interest of 100 l. for 9 months, and I am now to find the Interest of 75 l, for 9 months 3 to effect which, I make this 4th number (found as before) to be my second number in the next Question, and say, If 100 l, require 4 l. 10 s, what-will 75 k require? This Question I find (by the faid third Rule of the 11h Chapter) to be Direst, and by the faid 7th, 8th, and 9th Rules of the 10th Chapter, I find the Answer to be as before, viz. 2l. 7s, 6d.

This Rule hath been fufficiently explained by the fofegoing Example, fo that the Learner may be able to refolve the following (or any other) Queficions pertilient to the *double Rule of 3 Direll*, whole. Anfwers are there given, but the Operation purpolely omitted to try the Learner's ability in the knowledge of what hath been before delivered.

Queft. 2. A fecond Example in this Rule may be as followeth, viz. A Carrier receiving 42 fhillings for the Carriage of 300 weight 1 50 miles, I demand how much he ought to receive for the Carriage of 7 C. 3. grs. 14 l. 50 miles at that rate? Anfwer, 36 s. 9 d.

Quess. 3. A Regiment of 936 Soldiers eat up 351 quarters of Wheat in 168 days, I demand how many quarters of Wheat 11232 Soldiers will eat in 56 days at that rate ? Anfwer, 1404 grs.

Queft. 4. If 40 Acres of Grafs be mowed by 8 Men in 7 days, how many Acres thall be mowed by 24 Men 0-28 days? Anjmer, 480 Acres. Queft. Quefl. 5. If 48 bushels of Corn (or other Seed) yield 576 bushels in 1 year, how much will 240 bushels yield in 6 years at that rate? That is to fay, if there were fowed 240 bushels every one of the 6 years? Anfwer, 17280 bushels.

Queft. 6. If 40 fhillings is the Wages of 8 Men for 5 days, what fhall be the Wages of 32 Men for 24 days? Answer, 768 fhillings, or 38 l. 8 s. Queft. 7. It 14 Horfes eat 56 bushels of Provender

Queft. 7. It 14 Horfes eat 56 bulhels of Provender in 16 days, how many buthels will 20 Horfes eat in 24 days? Answer, 120 bufhels Quest. 8. If 8 Cannons in one day spend 48 barrels

Quest. 8. If 8 Cannons in one day fpend 48 barrels of Powder, I demand how many barrels 24 Cannons will fpend in 12 days at that rate? Anfwer, 1728 barrels.

Quest: 9. If in a Family, confifting of 7 performs, there are drunk out 2 Kilderkins of Beer in 12 days, how many Kilderkins will there be drunk out in 8 days by another Family confifting of 14 performs? Anywer, 48 Gallons, or 2 Kilderkins and 12 Gallons.

Queft. 10. An Ulurer put 751. out to receive Interest for the same, and when it had continued 9 months, he received for. Principal and Interess 781. 75. 6d. s demand at what rate per Cent. per Annum, he received Interess? Answer, at 61. per Cent. per Annum.

CHAP. XIII.

The double Rule of Three Inverse:

1. THE double Rule of 3 Inverse; is, when a Queffion in the double Rule of 3 is refolved by 2 fingle Rules of 3, and one of those stugle Rules falls out to

Reciprocal (for both the Queficions are never Inverse.)

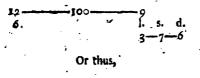

s. in all Queftions of the Double Rule of 3 (as well Inverfeas Direst) you are in the difpoing of the s given 136

given numbers) to obferve the 7th Rule of the rath Chapter, and in refolving of it by two fingle Rules, obferve to make choice of your numbers for the first and fecond fingle Queffions according to the directions given in the eighth Rule of the fame Chapter, as in the Example following, viz.

Quest. I. If 100 l. Principal in 12 months gain 6 l. Interest, what Principal will gain 3 l. 7 s. 6 d. in 9 months?

This Question is an Inversion of the first Question of the 12th Chapter, and may serve for a proof thereof.

In order to a Refolution, I dispose of the s given numbers according to the 7th Rule of the last Chapter, and being so disposed, will stand as followeth.

Here observe, that according to the eighth Rule of the twelfth Chapter, the first Queffion, if you take it from the s numbers (as they are ordered or placed first) will be, If 12 months require 100 l. principal, what will 9 months require to make the fame Interest? This (according to the third Rule of the 11th Chapter) is Inverse, and the answer will be found (by the 2d Rule of the 11th Chapter) to be 1331. 65. 8 d. the fecond question then will be, If 6 l. Interest require 1331. 65. 8 d. principal, how much principal will 31. 75. 6 d. require ? This is a direct Rule, and the answer in a direct proportion is 75 l. See the Work.

-	144	168	•	~	
	1152 1152 (0)	120 120 (0)		· · · ·	

So that by the foregoing Work I find that if 6 l. Interest be gained by 100 l. in 12 months, 3 L 7 s. 6 d. will be gained by 75 L in 9 months.

But if the refolution had been found out by the Numbers as they are ranked in the fecond place, then the fecond Question in the fingle Rule would have been Inverse, and the first Question Dires, and the conclufion the fame with the first method, viz. 75 l.

Quest. 2. If a Regiment confifting of 936 Soldiers can eat up 351 quarters of Wheat in 168 days, how many Soldiers will eat up 1404 quarters in 56 days at that rate ? Anfwer, 11232 Soldiers.

Queft. 3. If 12 Students in 8 Weeks fpend 48 l. I demand how many Students will fpend 288 l. in 18 Vecks? Anfwer, 32 Students. Queft. of Three Inverse.

Chap. 1.4.

Queft. 4. If 48 1. ferve 12 Students 8 Weeks, how many Weeks will 288 1. ferve 4 Students ? Anfwer, 1 44 Weeks.

Queft. 5, If when the bushel of Wheat coft 3 s. 4 d. the penny Loaf weigheth 12 ounces, I demand the weight of the Loaf worth 9 d. when the bushel coft Do s. ? Anfwer, 36 ounces.

Queft: 6. If 48 Pioneers in 12 days caft a Trench 24 yards long, how many Pioneers will caft a Trench 168 yards long in 16 days ? Anfwer, 252 Pioneers.

Rueft. 7. If 12 C. weight being carried 100 miles coft 51. 12 s. I defire to know how many C. weight may be carried 150 miles for 121. 12 s. at that rate? Anfwer, 18 C.

Queft. 8. If when Wine is worth 30 l per Tun, 20 pounds worth is fufficient for the ordinary of 100 Men,

how many Men will 4 pounds worth fuffice when it is worth 24 l. per Jun ? Anfwer, 25 Men. Queft. 9. If 6 Men in 24 days mow 72 Acres, in hom many days will 8 Men mow 24 Acres? Anfwer, in 6 days,

Queft. 10. If when the Tun of Wine is worth 30 l. 100 Men will be fatisfied with 20 L worth, I defire to know what the Tun is worth when 41 worth will fatisfie 25 men at the fame rate ? Anfwer, 24 l. per Tun.

CHAP. XIV.

The Rule of Three composed of five Numbers.

T HE Rale of Three Composed, is, when Que-flions (wherein there are 5 numbers given to find a 6th in proportion thereunto) are refolved by one

fingle Rule of 3 composed of the 5 given numbers. 2. When Questions may be performed by the double Rule of 3 Direct, and it is required to refolve them by the Rule of 3 composed, (first order or rank your. Numbers according to the 7th Rule of the 12th Chapter, then) The

139

Chap. 14.

The Rule is,

Multiply the Terms or (Numbers) that fiand one over the other, in the first place, the one by the other, and make their product the first Terms in the Rule of Three Direct, then multiply the Terms that fland one over the other, in the third place, and place their product for the third term in the Rule of Three Direct, and put the middle term of the three uppermost for a fecond term ; then having found a fourth proportional, direct to these three, this fourth proportional fo found, shall be the Answer required.

So the first Question of the 12th Chapter being propoled, viz. If 100 /. in 12 months gain 6 l. Interest, what will 75 l. gain in 9 months? The Numbers being ranked (or placed) as is there directed and done.

Then I multiply the two first terms, 100 and 12, the one by the other, and their product is 1200 (for the firm term;) then I multiply the two last terms 75 and 9 together, and their product is 675, for the third term. Then I say, as 1200 is to 6, 10 is 675 to the Answer, which by the Rule of Three Direct will be found to be 31. 72. 6 d. as was before found.

3. But if the Queilion be to be aniwered by the double Rule of Three Inverfe, then (having placed the five given terms as before) multiply the lowermost term of the first place, by the uppermost term of the third place, and put the product for the first term; then multiply the uppermost term of the first place, by the lowermost term of the third place, and put the product for the third term, and put the fecond term of the three highest Numbers for the middle term to those two, then if the inverse proportion is found in the uppermost three numbers, the 4th proportional Direct to these three flall be the answer; fo the first Queit ion of the 13th Chapter being flated, wiz. If a 100 L Principal in 12 months gain 6 L Intemell, what Principal will gain 3 L 72. 6d. in 9 months? State the Numbers as is there directed in the first order, wiz. Chap. 14. Composed of five Numbers.

then reduce the 61. and 31. 75. 5 d. into pence, the 61. is 1440 d. and 31. 75. 6 d. is 810 d. then multiply 1440 by 9, the product is 12960 for the first, term in the Rule of Three Diract, and multiply 810 by 12, the product is 9720 for the third term, then I fay, As 12960 is to 1001. To is 9720 to the Answer, wiz. 751. as before. But if the terms had been placed after the second order, viz.

1.	·* ·	jil.	i	ني ا. ــــــــــــــــــــــــــــــــــــ	<u></u> 5,	d.
M.	1.5		1	5 M.		0
- 12	`.	•		· 9		

then the Inverse Proportion is found in the lowest Numbers, and having composed the Numbers for a fingle Rule of Three as in the fecond Rule foregoing, then the Answer must be found by a single Rule of Three Inverse; for here it falls out to multiply 830 by 12 for the first Number, and 1440 by 9 for the third Number, and then you must lay, As 9720 is to 1001. So 12960 to the Answer, which by Inverse Proportion will be found to be 751. as before.

The Questions in the 12th and 13th Chapter's may ferve for thy farther Experience.

CHAP. XV.

Single Fellowship.

FELLOWSHIP is that Rule of Plural Proportion, whereby we ballance Accompts detogenerity Goog pending pending between divers Perfons having put together a general Stock, fo that they may every Man have his proportional part of Gain, or sultain his proportional part of Lois.

2. The Rule of Fellowship is either fingle, or it is double.

3. The fingle Rule is when the Stocks propounded are tingle Numbers without any respect or relation to time, each Partner continuing his Money in Stock for the fame time.

'4. In the fingle Rule of Fellowship, the proportion is as the whole Stock of all the Partners is in proportion' to the total Gain of Lofs, fo is each Man's parti-cular fhare in the Stock, to his parficular fhare in the Gain or Lofs. Therefore take the Total of all the Stocks for the first Term in the Rule of Three, and the who'e Gain or Lois for the fecond Term, and the particular Stock of any one of the Partners for the third Term, then multiply and divide according to the 7th Rule of the 9th Chapter, and the 4th proportional Number is the particular Lofs, or Gain of him whole Stock you' made your fecond number, wherefore repeat the Role of Three as often as there are particular Stocks, or Partners in the queffion, and the 4th Terms produced upon the feveral Operations are the refpettive Gain or Lofs of thole particular Stocks given; as in the Examples following.

Queft. i. Two Perfons, viz. A and B, bought a Tun of Wine for 20 l. of which A paid 12 l. and B paid 8 l. and they gained in the Sale thereof 5 l. now I demand each Mans share in the Gains according to his Stock?

First, I find the Sum of their Stocks, by adding them together, viz. 12 l. and 8 l. which are 20 l. then according to 12 this Rule, I fay first, If 20 l. (the 8 Sum of their Stocks) require $\leq l.$ the total Gain, how much will 12 l. 20 l. (the Stock of A) require ? Multiply and Divide by the 7th Rule of the ninth Chapter, and the Answer is 3 l. for the share of A in the construction of the stock of A in the construction of A in the Chap. 15. Single Fellowship.

143

78

Google Queft.

1. 48,

72

Sum 264

gains; then again I fay, If 20 l. require 5 l. what will 8 l. require? The Anfwer is 2 l. which is the gain of B. So I conclude that the fhate of A in the gain is 3 L' and the share of B in the gain is 2 l. which in all is s L

Quest. 2. Three Merchants, viz. A, B, and C, enter upon a joint Adventure, Alput into the common flock 78 l. B put in 1 17 l. and C put in 234 l. and they find (when they make up their Accompts) that they have gained in all 264 l. now I defire to know each Mans particular share in the gains ?

(A)

R

First, I add their particular flocks together, and their Sum is 429 l. then fay, If 429 L gain 264 L what will 78 L gain ? and what 117 L and what will 234 1. (the Stocks of A, B, and C,) gain? Work by three feveral Rules of 2, 5um 429 and you will find that

The Gain of

Single Fellowship.

144

Chap. 15

Quefl. 3. Four Partners, vie. A, B, C, and D, between them built a Ship which coft 17301. of which A paid 3461. B 5191. C 6921. and D 1731. and her Freight for a certain Voyage is 3701. which is due to the Owners or Builders, I demand each Man's fhare therein according to his Charge in building her.

Sum 370

Quest. 4. A, B, and C, enter Partnership for a certain time, A put into the common stock 3641. B put in 4821. C put in 5001. and they gained 8671. now I demand each Man's share in the Gain proportionable to his Stock.

> Anfwer, l. s. d. $A \begin{cases} 234 - 09 - 3134 \\ 310 - 09 - 5134 \\ 322 - 01 - 3134 \\ 322 - 01 - 3134 \\ 3134 \\ 547 - 20 - 0 \end{cases}$

5. To prove the Rule of Single Fellow/hip, add each Man's particular Gain or Lois toge-The Proof of the ther, and if the total Sum is equal Rule of Single to the general Gain or Lois, then Fellow/hip. is the Work rightly performed, but otherwife it is Erronious. Example, In the first Question of this Chapter, the An-

firer was that the Gain of A was 3 *l*. and the Gain of B 2 *l*. which added together make 5 *l*. equal to the total Gain given.

Ħ

d by Google •

Chap. 16.

If in finding out the particular Shares of the several Partners, any thing remain after Division is ended, fuch remainders must be added together, (they being all Fractions of the fame denomination) and their fum divided by the common Divisor in each Question (viz, the total flock) and the quotient add to the particular Gains, and then if the total Sum is equal to the total Gain the work is right, otherwise upt,

As in the fourth Queffion, the remainders were 354, 62, and 930, which added together make 1346, which divided by 1346, (the fum of their Stocks) the Quotient is 1 d. which I add to the pence, Grc. and the fum of their fhares is 867 *I*, equal to the total Gain; wherefore I conclude the work is right.

CHAP. XVL

Double Fellowsbip. -

I. Double Fellowschip is when feveral Perfons enter into *Partner/bip* for unequal time, that is, when every Man's particular Stock hath relation to a particular Time.

2. In the double Rule of Fellowship, multiply cash particular. Stock by its respective time, and having added the several products together make their lim the first number (or term) in the Rule of 3, and the total gain or loss the second number, and the product of any, ones particular Stock by his time, the third term, and the 4th number in proportion thereanto is his par, icular gain or loss, whose product of Stock, and Time is your, third number.

Then repeat (as in Single Fellowship) the Rule of 3. as often as there are products or (Partners) and the 4 serms thereby invented are the sumbers required. Example.

Queft. I. A and B enter Partnerschip, A put in go. le for 3 months, B put in 75 t. for 4 months, and they H Google gained. 146

Chap. - 16

gained 70 l now I demand each Main's fibare in the gains, proportionable to his flock and time? Anywer, A 20 l. B 30 l.

To refolve this Queflion, I first multiply the Stock of A, (viz. 40.1) by its time (3 months) and the Product is 1. 1. 3.20, then I multiply the Stock 40 75 of B by its time (viz. 75 by 4) and it produceth 300, which Hold add to the Product of A his 'A' 120 B'368 Stock and Time, and 'the Tum 'is 420. Then by the Rule of 3 Direct, I fay, AI 420 (the Sum 420 Sum of the Products) is to 70

(the total gain) fo is 120 (the product of A his Stock and time) to 207. (the fhare of A in the gains) and fo is 300 (the product of B his Stock and time) to 50%. (the fhare of B in the gains.) And fo much ought each to have for his fhare.

Quefl. 2. A, B and C, make a Stock for 12 Months, A put in at first 3641. and 4 Months after that he put in 40 l. B put in at first 408 l. and at the end of 4 Months he took out 86 l. C put in at first 148 l. and 3 Months after he put in 86 l. more, and 5 Months after that he put in 100 L more, and at the end of 12 Months their gain is found to be 1436 l. I defire to know each Man's thare in the gains according to his Stock and time 3.

First, I confider that the whole time of their Partnership is 12 Months. Then I proceed to find out the Several products or Stock and Time as followeth.

A had at first 364 ?. for 4 months, } 1456

Then he put in 40 l, which with the first Sam makes 404 l, which continued the remainder of the time, viz. 8 months, and their product is

Alligation Medial.

Quel. 3. Three Grafiers, A, B, and G, take a piece of Ground for 46 I. 105. in which A put in 12 Oxen for 8 months, B put in 16 Oxen for 5 months, and C put 18 Oxen for 4 months, now the queltion is, what thall each Man pay of the 461. 105. for his filare in shat charge?

3. The proof of this Rule is the fame with that of Single Fellowfhip, laid down in the 5th Rule of the 5th Chapter; and note that,

It a loss be fultained inftead of gain among Partacts, every Man's flare to be born in the loss is to be found after the fame method as their gain, whether their Stocks be for equal or unequal time.

C H-A P. XVII.

Alligation Medial.

THE Rule of Alligation is that Rule in planal proportion, by which we relate Quertions, wherein is a composition or mixture of divers imples, asallo it is useful in the composition of Medicines both for quantity, quality, and plass. And its species are two, viz. Medial and Alternate.

two, siz. Medial and Alternate. a. Alligation Medial is, when having the feveral quantities and prices of feveral fimples propounded, we difcover the mean price or rate of any quantity of the mixture compounded of those fimples, and the proportion is,

As

Chap.17.

Chap. 17.

1.1.29

As the fum of the fimples to be mingled is to the total value of all the fimples, fo is any part or quantity of the composition or mixture to its mean Rate or Price.

Queff. 1. A Farmer mingleth 20 bulhels of Wheat at 5 s. per bulhel, and 36 bulhels of Ryc at 3 s. per buffiel, with 40 bufhels of Barley, at 2 s. per bufhel, now I defire to know what one bushel of that mixture is worth ?

To refolve this Question add together the given quantities, and also their values, which is 96 bufhels, whole total value is 14 h 8 A as appeareth by the Work following ; for,

bufb. L 20 of Wheat at 5 s. per Bufbel, is 5-0 36 -of Rye as 3 s. per Bufbel, is 5-8 40 of Barley at 2 s. per Bufbel, is 4 -- 0

Pacit, 35. per Busbel.

The Sum of the siven \$ 95, and their value is -14---8 anantities is Then fay by the Rule of 3 Direct, If 96 bulhels coft (or is worth) 12 1. 85. what is r bulhel worth ?

> bufb. s. bufb. 96) 288 (21. 288

(0)

Quelt. 2. A Vintner mingleth 15 Gallons of Canary at 8s. per Gallon, with 20 Gallons of Malaga at 7s. 4d. per Gallon, with to Gallons of Sherry at 6s. 8d. per Gallon, and 24 Gallons of White-wine at 4s. per Gallon. now I demand what a Gallon of that mixture is worth ? Work as in the laft Queftion, and you will find the Answer to be 6s 2d. 2grs- 45. Digitized by Google Quest.

H 2

Alligation Alternate. Chap. 18.

140

Queff. 3: A Grocer hath mingled 3 C. of Sugar at 36 s. per C, with 3 C. of Sugar at 3 l. 14s. 8d. per C. and with 6 C. at 1 l. 17 s. 04 d. per C. I defire to know the price of an hundred weight of that mixture? Anfwer, 2 l. 11 s. 4 d.

3. The proof of this Operation is by the price of any quantity of the mixture to find out The Proof of the total value of the whole compositi-Alig. Medial. on, and if it is equal to the total value of the feveral fimples, the work is right, otherwise not. As in the first Example, the answer to the question was that 3s. is the price of one bushel, wherefore I fay by the Rule of Proportion, if I bushel

be 3 millings, what is 06 bushels? Answer, 141. 8s. which is the total value of the feveral fimples, wherefore the Work is right.

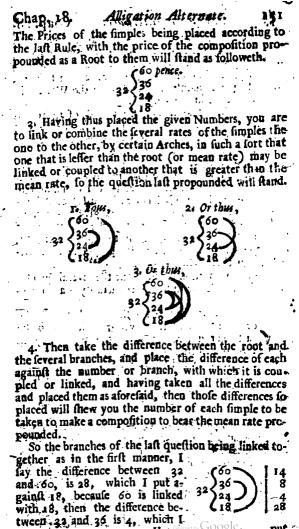

CHAP. XVHL

Alligation Alternase.

2. A Lligation Alternate is when there are given the particular prices of feveral fimples, and thereby we discover such quantities of those fimples, as being mingl'd together shall bear a certain rate propounded.

2. When fuch a queffion is flated, place the given prices of the fimples one over the other, and the propounded price of the composition against them in such fort that it may represent a Root, and they to many branches springing from it, as in the following example. Queft: 1. A certain Farmer is defirous to mix 20 bushels of Wheat at 5s. or 6od. per bushel, with Rye at 2s. or 36d. per bushel, and with Barley at 2s. or 24d. per bushel, and Oats at 1s. 6d. per bushel, and defireth to mix such a quantity of Rye, Barley and Oats with the 20 bushels of Wheat, as that the whole composition may be worth 2 s. 8 d. or 22 d. per bushel

The

H_A S

put 🐃

Alligation Alternate. - Chap. 18.

152

2

fut against 24, because 36 is linked or coupled with 24, then I fay the difference between 32 and 24 is 8, which I place against 36 (for the reason aforefaid) then I fay the difference between 32 and 18 is 14, which I place against -60; and then the Work will stand as you see in the Margent.

So I conclude that a composition made of 14 businels of Whoat at 60 d. per businel, and 8 businels of Rye at 36 d. per businel, and 4 businels of Barley at 24 d. per businel, and 28 businels of Gats at 18 d. per businel, will bear the mean price of 32 d. or 2 s. 8 d. per businel. And here observe that in this composition there is but 14 businels of Wheat; but I would mingle 20 businels, and this kind (or rather cafe) of Alligation Alternate (viz.) when there is given a certain quantity of one of the fimples, and the quantities of the relt fought to mingle with this given quantity, (that the whole may bear a price propounded) is called Alternation Partial,

And the proportion to find out the feveral quantitics to be mingled with the given quantity is as followeth, viz.

As the difference annexed to the branch that is the value of an integer of the given quantity, is to the other particular differences, to is the quantity given to the leveral quantities required.

So here, how to find out to much Rye, Barley and Oats as mult be mingled with the 20 bulhels of Wheat, I fay by the fingle Rule of 3 Direct, if 14 bulhels of Wheat require 8 bulhels of Rye, what will 20 bulhels of Wheat require? Anfmer, $11_{T_{2}}$ bulhels of Rye.

of Wheat require? An/wer, $I_{T_{\tau}}^{e}$ bulhels of Rye. Again, if 14 bulhels of Wheat require 4 bulhels of Barley, what will 22 bulhels of Wheat require? An/w s_{τ}^{2} bulhels of Barley. Again I fay, if 14 bulhels of Wheat require 28 bulhels of Oats, what will 20 bulhels of Wheat require? An/wer, 40 bulhels of Oats.

And, now I fay, that 20 buffiels of Wheat mingled with 1_{17} buffiels of Rye, and 5^{++}_{17} buffiels of Barley, and 40 buffiels of Oats, each bearing the Rates as aforefaid, will make a composition or heap of Corn that may yield 32 *d.* per buffiel: But Alligation Alternate.

But if the branches had been coupled according to the fecond order, or manner, the differences would have been thus placed, viz. the

differences between 32 and 60 is 28, which I fet against 24, becaule 60 is linked thereto; and the difference between 32 and 36 is 4, which I fet against 18,

and the difference between 32 and 24 is 8, which I let again the difference between 32 and 24 is 8, which I let again too; then the difference between 32 and 18 is. 14, which I fet again this yoke-fellow 36, and then I conclude that if you mix 8 bathels of Wheat with 14 bulhels of Rye, 28 bulhels of Barley, and 4 bulhelsof Oats, each bearing the aforefaid Prices, the whole mixture may be fold for 32 d. per bulhel, as by the work in the Margent.

You fee by this work, we have found how many bulhels of Rye, Barley and Oats, ought to be mixed with 8 bulhels of Wheat, and to find out how many of each ought to be mixt with 20 bulhels of Wheat, I fay, as 8 is to 14, fo is 20 to 35 bulhels of Rye. As 8 is to 28, fo is 20 to 70 bulhels of Barley. As 8 is to 3 4, fo is 20 to 10 bulhels of Oats, whereby 1 conclude that if to 20 bulhels of Wheat I put 35 bulhels of Rye, 70 bulhels of Barley, and 10 bulhels of Oats, beating each the forefaid prices per bulhel, that then a bulher of this mixture will be worth 32 d. or 2 d. 8 d.

And if the Branches had been linked as you fee in the third place, where each branch bigger than the root, is linked to two that are leffer than the root, then in this cale you mult have placed the feveral differences between the root and branches, against those two with which each is coupled, as first the difference between 32 and 60 is 28, which I put against 24 and 18 becaufe it is coupled

8,14 22

28.4

22

153

Chap. 18.

Alligation Alternate.

154

with them both, then the difference between 32 and 36 is 4, which I fet likewife against 24 and 18, becaufe 36 is linked to them both, then the difference between 32 and 24 is 8, which I put against 60 and 36, becaufe 24 is linked to them both, then the difference between 32 and 18 is 14, which I put against 60 and 26, the yoke-fellows of 18.

Chap. 18.

Laftly, I draw a line behind the differences, and add the differences which fland againft each branch, and put the fum behind the fuld line againft its proper branch, as you fee in the Margent.

And now by this work I find that 22 builtels of the Wheat mingled with 22 builtels of Rye, and 32 builtels of Barley, and 32 builtels of Oats, each bearing the faid price will make a mixture bearing the mean-rate of 32 d. per hulhel.

And to find how much of each of the reft must be mingled with 20 bulhels of Wheat, I fay,

As 22 is to 22, fo is 20 to 20 bulkels of Ryc. As 22 is to 32, fo is 20 to $29_{3\frac{3}{2}}$ bulkels of Barley. As 22 is to 32, fo is 20 to $29_{3\frac{3}{2}}$ bulkels of Oats.

Whereby you fee the queffions of Alligation Altermate will admit of more true Anfwers than one s for we have found three feveral Anfwers to this first Queffion.

Quellions of Alternation partial are proved the fame way with Queflions in Alli-The Proof of Altern nation partial. In the 3d. Rule of the 17th Chap. Quefl. 2. A Grocer hath 4 forts of Sugar, viz. of 12d. per 1: of 10d. per 1. of 6d. per 1: and of 4d. per 1, and he would have a composition worth 8d. per 1: the whole quantity whereof should contain 144 L made of the 4 forts, 1 demand how much of each he must take ?

Queffions of this nature are refolved by that part of Alligation alternate called by Arithmeticians Alternation total, viz, where there is given the fum, and prices of feveral fimples to find out how much of each fimple ought to be taken to make the faid fum or

quantity.

Chap. 18, Altigation Alternate.

155

quantity, fo that it may bear a certain Rate propounded.

To refolve this Queftion I place the feveral prices of the imples and mean rate propounded, and link them together, as is directed in the 2d and 3d Rules of this Chapter, and place the differences between the root and branches according to the 4th Rule of this Chapter, which will then stand one of these three ways, with

> 12 Third

Second.

Firft

5. Then add the leveral differences together, which I have done, and the lums of the first and second order are 12 *l*. and of the third 24 *l*. as you may see above; but it is required that there should be 444 *l*. of the composition, therefore to find the quantity of each finaple, to make the whole composition 144 *l*. observe this general Rule, viz.

As the fum of the differences is to the feveral differences, fo is the total quantity of the composition to the quantity of each fimple.

So to find how much of each fort of Sugar I ought at take to make 144.1. at 8d. per 1.

As 12 is to 4, to is 144 to 481, at 12d, per t. As 12 is to 2, to is 144 to 241, at 10d, per l. As 12 is to 2, to is 144 to 241, at 10d, per l. As 12 is to 2, to is 144 to 241, at 6d, per l. As 12 is to 4, to is 144 to 481, at 4d, per l. Whereby Alligation Alternate.

بر 150

Whereby 1 find that 48 *l*. at 12 *d*. per *l*. and 24 *L* at 10 *d*. per *l*. and 24 *L* at 6 *d*. per *l*. and 48 *l*. at 4*d*. per *l*. will make a composition of Sugar containing 144 *l*. worth 8*d*. per *l*.

But as the branches are linked in the fecond order, the answer will be 241. at 12d perl. and 481. at 10d. per 1. and 481. at 6d. per 1. and 241. at 4d. per 1. to make the faid quantity, and to bear the faid price.

And if you had worked as the branches are linked after the third order, then you would have found the quartity of 39 1. of each. Queft. 3 A. Vintner hath four forts of Wine, or. Ca-

Queft. 3 A Vintner hath four forts of Whe, orz. Canary at 10s. pr Gallon, Malaga at 82 per Gallon; Rhenfift-wine at 6s. per Gallon; and White-wine at 4s. per Gallon, and he is minded to make a Compontion of them all of 60 Gallons that may be worth 5 fhillings per Gallon, I defire to know how much of each he must have t

The numbers of terms being lanked according to the fecond Rule of this Chapter, the branches will be linked as tolloweth, and will admit of no other manner of coupling, becaule there is but one branch that is leffer than the Root; therefore all the reft must be linked unto it; and the . Iċ differences between the 8 Root and the three first . I branches, viz, 10, 8.4 and 6, which are 5, 3, and r, must be fet against 4, because they are all coupled with it, and the difference between the Root, (viz. 5.) and 4, which is 1, must be let against the three other, because it is linked to them all,; so I find I Gallon of Canary, I Gallon of Malaga, 1 Gallon of Rhenifh-wine, and 9 Gallons of White-Wine, prized as above being mingled together, will be worth 5s. per Gallon, the fum being 12 Gallons, but there must be 60 Gallons; wherefore I fay,

As 12 is to 1, to is 60 to 5 Gallons of Canary. As 12 is to 1, to is 60 to 5 Gallons of Mallaga

3.12 is to 1, fo is 60 to 5 Gallons of Rhemiln.

i i is to 9, fo is 60 to 45 Gallons of White-wine.

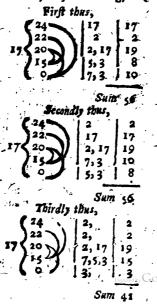

Chap, 18,

Alligation Alternate.

157

So that s gallons of Canary, s gallons of Malaga, s gallons of Rhenifh, and 45 gallons of White-wine mingled together, will be in all 60 gallons, worth sr, ' per gallon, which was required.

Queff. 4. A Goldfmith hath Gold of 4 feveral forts of finencis, size of 24 Carefts fine, and of 22 Carefts fine, of 20 Carefts Read Chap. 2. fine, and of 15 Carefts fine. And def. 2. of this he would mingle fo much of each Book with alloy, that the whole Mais of 28 ounces of Gold fo mingled may bear 17 Carefts. fine. I demand how much of each he musit take, the fecond and third Rules of this Chapter being obferved, (for infread of the alloy Fput o, becaufe it bears no finencis, but it makes a branch in the Operation) the terms may be alligated and the differences. added any of thefe 4 ways following, with

Alligation Alternate.

[24	2, 17	19
22	2, 17	19
17 20	2, 17	19
15-411	7, 5, 3,	15
Outstand	7, 5, 3,	15
	Sum	87.

Chap: 18.

More ways may be given for the Alligating, or linking of the Terms in this Question, but these are sufficient for the Industrious, and it shall also suffice to give an answer to the Question as the Terms are link'd the first way, not doubting but the ingenious Practitioner will be able at his leiture, to find Answers to the other 2 ways, viz. 97. p.w. car.

As 56 is to 17, fo is 28 to 8 - 10 of 24 As 56 is to 2, fe is 28 to 70 - 00 of 22 As 56 is to 19, fo is 28 to 70 - 00 of 20 As 56 is to 18, fo is 28 to 4 - 00 of 15 As 56 is to 18, fo is 28 to 5 - 00 of 15 As 56 is to 10, fo is 28 to 5 - 00 of alloy.

Thus much well practifed and underflood, is fufficient for the underflanding of Alligation.

In Qualitions of Alternation Total, The proof of Alternation Total, the Answer given is true, when the ternation Total. fum of each of the quantity of fimples found, agrees with the Sum or quan-

tity propounded, as in the last Queffion, the Answer was 8 oz. 10 p.m. of 24 Carects fine, 10 oz. of 22 Carects fine, 9 oz. 10 p.m. of 20 Carects fine, 4 oz. of 15 Carects fine, and 5 oz. of Alloy, which added together make 28 oz. the quantity propounded.

CHAP. XIX.

Reduction of Vulgar Fractions.

1. W Hat a Vulgar Fraction is, and its parts and feveral kinds, hath been already thewed in

the

Reduction of, &c.

the 19, 20, 21, 22, 23, 24, and 31 Definitions of the first Chapter of this Book, which the Learner is defired diligently to observe before he proceeds.

2. To reduce a Vulgar Fraction (which different the principal knowledge of Fractions, and therefore ought greatly to be regarded) we shall different plainly under these eight several Heads (or Rules) following, viz.

r. To reduce a mixt' number into an improper Fraction.

2. To reduce a whole number into an improper'

3. To reduce an improper Fraction into its equivalent whole (or mixt) number.

4. To reduce a Fraction into its lowest terms equivalent to the Fraction given.

5. To find the value of a Fraction in the known parts of Coyn, Weight, Measure, &c.

6) To reduce a. compound Fraction to a fimple one of the fame value.

7. To reduce divers Fractions having unequal Denominators, to Fractions of the fame value, having an equal Denominator.

8. To reduce a Fraction of one Denomination to another of the fame value.

I. To reduce a mixt Number to an improper Fraction.

The Rule is,

depn. 31.

· ... Vide Chab. I.

1593

Multiply the Integral part (or whole Number) by the denominator of the Fraction, and to the Product add the Numerator, and that Sum place over the Denominator for a new Numerator, to this new Fraction thall be equal to the mixt number given. As for Example.

1. Reduce $18\frac{3}{7}$ into an improper Fraction, multiply the whole number 18 by 7 the desominator, and to the Product add the numerator 3, the Sum is 129, which put over the denominator 7, and it makes $12\frac{3}{7}$, for the Anfwer, as followeth. $18\frac{3}{7}$. Reduction of

7 129 facit

181

76

2. Reduce 183 17 to an improper fraction, facit 3 841 3. Reduce 36 18 to an improper fraction, facit 3 841

129

IL. To reduce a whole Number to an improper fraction.

The Rule is,

Multiply the given Number by the intended denominator, and place the Vide Chap. 1. product for a numerator over it. As defin. 23. for Example.

2. Reduce 36 into an improper fraction whose denominator shall be 26, fatit 215.

3. Reduce 135 into an improper fraction whole denominator shall be 16, facit 3 1 49.

III. To Reduce an improper fiation into its equivalent whole or mint number.

The Rule ng

Divide the Numerator by the Denominator, and the Quotient is the whole number equal to the fraction, and it any thing remain, pat is for a Numerator over the Divitor, Example.

I. Reduce

Chap. 19.

Chap. 19.

161

s. Reduce 43 into its equivalent mixt number, divide the Numerator 436 by the denominator 8, and the quotient is 54, and 4 remains, which put for a numerator over the divifor 8, the Answer is 54 $\frac{4}{1}$, as followeth.

8) 436 (54

40

30 32 facit 54 f

a Reduce \$475 to a mixt number, facit 2315. 3. Reduce \$575 to a mixt number, facit 114772.

IV. To reduce a frattion into its loweft terms equivalent to the frattion given.

The Rule is.

i. if the numerator and accommator are even numbers, take half of the one, and half of the other as often as may be, and when either of them falls out to be an odd number, then divide them by any number that you can difcover will divide both numerator and denominator, without any Remainder 5 and when you have thus proceeded as low as you can reduce them, then this new Fraction to found: out shall be the Fraction you defire, and will be in value equal to the given Fraction. Example.

1. Let it be required to reduce $\frac{1}{23}$ into its loweft ferms. Firft, I take the half of the Numerator 192 and it is 96, 336 168 84 42 21 7 then half of the Denominator, and it is 168, fo that now it is brought to $-\frac{3}{25}$, and next to $\frac{3}{21}$, and by halfing ftill to $\frac{3}{4}$, and their half is $\frac{1}{27}$, and now I can no longer half it, becanfe 21 is an odd number, wherefore I try to divide them by 3, 4, 5, 6, 69e. and I find 2 divides them both without any remainder, and brings them to 3, as per-Margent. So I conclude 4 thus found to be equal in value to

the given frattion 122. 2. What is 112 in its loweft terms? Answer 2. . 3. What is + 143 in its loweft terms ? Anfwer 11.

There is yet another way more excellent than the

Math. Cap. 7.

102

2

former to reduce a frattion into its Vide Ought. Cla. loweft terms, and that is by finding a common Measurer, viz. the greateft number that will divide the nu-

/ Chap. 19.

merator and denominator without any remainder, and by that means reduce a frastion to its loweft terms at the first work ; and to find out this common measurer divide the denominator by the numerator, and if any thing remains divide your Divifor thereby; and if any thing yet remains, then divide your last Divisor by it; do to until you find nothing remains; then this laft Divisor shall be the greatest common measurer, which will divide both numerator and denominator, and reduce them into their lowest terms at one Work. 3.75

Example. measurer. To effect which, I divide the denominator 304 by the numerator 228 and there semains 76, then I divide 228 (the first Divisor) by 76 (the remainder) and it quotes 3, and nothing remains ; wherefore the laft Divisor 76 is the common measurer, by which I divide the numerator of the given Frakton, viz. 228, it quotes a form new numerator, then I divide the densminater 304 by 76, and it quotes 4 for a new denemi-nator, that now I have found & equal to 228.

5. Reduce fif into its loweft terms by a common measurer, facit Tf.

6. Reduce - 3.8 into its loweft terms by a common mealurer, facit 4.

A Compendium.

Note that if the numerator and denominator of a fra-Bion, and each with a Cypher or Cyphers, then cut off as many Cyphers from the one as from the other, and the remaining figures will be a Fraction of the fame value, viz. 14 will be found to be reduced to \$4. . by

Chap. 19.

Vidgar Frattions.

by cutting off the two Cyphers from the numerator and denominator, with a dash of the Pen thus, 34 ..., and 400, will be 40, thus 400. Oc.

V. To find the Value of a Fraction in the known parts of Coyn, Weight, &c.

The Rule is,

Multiply the numerator by the parts of the next inferiour denomination that are equal to an Unit of the fame denomination with the Fradiow, then divide that Product by the denominator, and the quote gives you its value in the fame parts you multiplied by, and if any thing remain multiply it by the parts of the next inferiour denomination, and divide as before, do fo till you can bring it no lower, and the feveral quotients will give you the value of the Fradion as was required, and if any thing at laft remain, place it for a numerator over the former denominator; tome it w Example, will make the Rule plain.

1. What is the value of $\frac{37}{2}$ l. Sterling? To abswer this Question I multiply the numerator 27 by 20 (the fhillings in a pound) the product is 540, which I divide by 29 (the denominator.) and the quotient is 18s. and there remains 18, which I multiply by 12, pence, and the product (216) I divide by the denominator 29, the quotient is 7d. and 13 remains, which I multiply by 4 Barthings, the product is 52, which. I fill divide by 29, the quotient is I Farthing, and there remaineth 23, which I put for a numerator over the denominator 29, fo I find the value of $\frac{37}{2}$. to be 18s. 7d. 167. $\frac{34}{2}$, as by the following Operation, and after the fame manner are the values of the Fractions in the feveral Examples following found out.

Vulgar Fractions.

VI. To, Reduce a compound Fration to a simple one of the fame value.

Chap. 19.

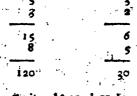

What a compound Fraction is, hath been flewed in Chap. I. Definition 24, and to reduce it to a fimple Fraction of the lame Value.

The Rule is,

Multiply the Numerators continually, and place the last product for a new Numerator, then multiply the Denominators continually, and place the last product for a new Denominator. So this fingle Fraction shall be equal to the compound Fraction given. Example.

L. Reduce ? of } of f to a fimple Fraction.

Multiply the Numerators 2, 3, and 5 together, they make 30 for a new Numerator 3 then I multiply the Denominators 3, 5, and 8 together, and their Product is 120 for a Denominator, fo the fimple Fraction is TT, and cutting off the Cyphers, it is T's equal to \$ by the fourth Rule foregoing,

Facit, +1: OF -1 OF -

2. What is - 2 of \$ of \$ of \$ of \$ Answer, \$ \$ \$ or \$ \$ \$ or 777 in its leaft terms.

3. What is $\frac{1}{13}$ of $\frac{1}{16}$ of $\frac{1}{16}$? Answer, $\frac{1}{26}$. By this you may know how to find the value of a Compound Fraction, viz. first reduce its to a fimple one, and then find out his value by the 5th Rule forcgoing. Google ExámReduction of

160:

Example. What is the value of $\frac{1}{2}$ of $\frac{1}{5}$ of $\frac{1}{5}$ of a pound $\frac{1}{5}$ Anywer, 11s. 3d-

VII. To reduce Fractions of unequal Denominators to Fractions of the fame value, having equal Denominators.

The Rule is,

Multiply all the Denominators together, and the Product thall be the Common Denominator. Then multiply each Numerator into all the Denominators except its own, and the last product put for a Numerator over the Denominator found out as before : So this new Fraction is equal to that Fraction, whole Numerator you multiplied into the faid Denominators. Do to by all the Numerators given, and you have your defire.

Example.

1. Reduce $\frac{1}{4}$, $\frac{4}{5}$, and $\frac{7}{4}$, to a common Denominator. Multiply the Denominators 4, 5, 6, and 8 together continually, and the product is 960 for the common Denominator; then multiply the Numerator 3 into the Denominators, 5, 6, and 8, and the product is 720, which is a Numerator to 960 (found as before) fo $\frac{2}{2}$; is equal to the first Fraction $\frac{1}{4}$, then I proceed to find a new Numerator to the fecond Fraction, wiz, $\frac{4}{7}$, and I multiply 4 (into all the Denominators except its own, wiz.) into 4, 6, and 8, which produce $\frac{2}{3}$; equal to $\frac{4}{7}$, then multiply the Numerator 5 into the denominators 4, 5, and 8, the product is $\frac{4}{3}$; equal to $\frac{5}{7}$. Then multiply the numerator 7 into the denominators 4, 5, and 6, the product is $\frac{4}{7}$; equal to 7, and the work is done; fo that for $\frac{1}{4}$, $\frac{4}{7}$, $\frac{1}{4}$, and $\frac{7}{4}$. I have $\frac{74}{74}$; $\frac{76}{74}$; $\frac{47}{74}$; $\frac{4}{3}$;

\$30, \$40. 2. Reduce 11, 14, and 12, into a common denominator, faciant \$358, \$158, and \$344.

vш.

zed by Google.

VIII. To reduce a Fration of one Denomination to another.

1. This is either Alcending, or Descending. Afcending when a Fraction of a smaller is brought to a greater Denomination, and Defcending when a Fraction of a greater Denomination is brought lower.

2. When a Fraction is to be brought from a leffer to a greater Denomination, then make of it a compound Fraction by comparing it with the intermediate Denominations between it, and that you would have it re-duced to, then (by the 6th Rule foregoing, reduce your Compound to a fimple Fraction, and the Work is done. Example.

Quest. 1. It is required to know what part of a pound fierling 5 of a peny is ? "To refolve this, I coulider that 1d. is -1 of a fail-

ling, and a fhilling is 11 of a pound ; wherefore \$ d. is $\frac{1}{2}$ of $\frac{1}{12}$ of $\frac{1}{2}$ of a pound, which by the faid 6th Rule I find to be $\frac{1}{123}$ of a l. fterling of English Money.

Queft. 2. What part of a pound Troy weight is 4 of peny weight ? Anfwer, it of 1: of 7: . equal to ----- I. Troy.

2. When a Fraction is to be brought from a greater to a leffer denomination, then multiply the Numerator by the parts contained in the feveral denominations betwixt it; and that you would reduce it to; then place the laft product over the denominator of the given Fraction. Example,

Quest. 3: I would reduce \$ L to the Eraction of a Peny; to do which I multiply the Numerator 3 by 20 and 12, the product is 720, which I put over the Denominator s, it makes 23 of a peny, equal to \$ 4. Queft. 4. What parts of an Ounce Troy is 751.?

Anfmer, 5: oz.

Chap. 19.

CHAP.

Chap. 20.

CHAP. XX.

Addition of Vulgar Fractions.

I. IF your Fractions to be added have a common Denominator, then add all the Numerators together, and place their fum for a Numerator to the common Denominator, which new Fraction is the Sum of all the given Fractions; and if it be improper, reduce it to a whole or mixt number, by the 3d. Rule of the 19th. Chapter.

Queft. I. What is the Sum of 17, 14, 14, and 14 3

The Denominators are equal, viz. every one is 24, wherefore add the Numerators together, viz. 7, 9, 16 and 14, their Sum is 46, which put over the Denominator 24, it makes $\frac{4}{5}$ the Sum of the given Fradions, which will be reduced to the mixt Number $1\frac{2}{5}$, or $\frac{1}{7}$.

2. But if the fractions to be added have unequal Denominators, then reduce them to a common Denominator by the 7th Rule of the 15th Chapter, and then add the Numerators together, and put the fum over the common Denominator, Grc. as before in the laft Example.

Queft. 2, What is the fum of \$, 7, -?, and 11?

The fractions reduced to a common Denominator are $\frac{38}{800}$, $\frac{410}{200}$, $\frac{412}{200}$, and $\frac{44}{200}$, the fum of their Numerators is 15800, which put over the common Denominator, makes $\frac{48}{200}$ or $\frac{148}{200}$, equal to the mixt number 212, or $\frac{2}{200}$ of the fum required.

number 314, or 3.2 for the lum required, Queff. 3. What is the lum of 11, 15, and 15? Anforer, 112 14.

3. If you are to add mfxt numbers together, then add the iractional parts as before, and if their ium be an improper fraction reduce it to a mixt number, and add its Integral part to the Integral parts of the given mixt Numbers, and the Work is done.

gnest, 4. What is the fum of 13 } and 24 #?

Firft

Chap. 20./

160

Quest.

First add the fractions $\frac{1}{2}$ and $\frac{1}{2}$, the Jum is $1\frac{1}{2}\frac{1}{2}$, then add this Integer 1, to 13 and 24, their jum is 38, and put after it the fraction $\frac{1}{2}\frac{3}{2}$ it is $38\frac{12}{2}\frac{1}{2}$ for the Answer, or it is $38\frac{1}{2}$.

Queft. 5. What is the fum of $48\frac{1}{2}$, $64\frac{1}{2}$, and $130\frac{1}{2}$? facit, $243\frac{18}{3}\frac{1}{2}$, or $243\frac{45}{2}$.

4. If any of the fractions to be added is a compound fraction, it mult first be reduced to a simple fraction by the 6th Rule of Chapter 19, and then add it to the rest, according to the 2d. Rule of this Chapter. Example,

Queff. 6. What is the fum of $\{1, 5\}$, and $\{2\}$ of $\{2\}$ of $\{3\}$ of $\{3\}$ of $\{3\}$ of $\{3\}$ into a fimple fraction, and it is $\frac{1}{3}$, which reduced with the other two, and added are $2\pi^{\frac{1}{3}}$.

Quest. 7. What is the fum of $\frac{1}{2}$ and $\frac{3}{4}$ of $\frac{4}{5}$ of $\frac{5}{5}$? Anfwer, $1-\frac{5}{4}$.

5. If the frations to be added are not of one denomination, they must be fo reduced, and then proceed as before.

Quest. 8. What is the Sum of \$ 1. and \$ s. ?

Of the given Fractions here; one is of a pound and the other the Fraction of a fhilling; and before you can add them together, you muft reduce $\frac{1}{2}$ s. to the Fraction of a pound as the other is (by the 8th Rule of Chapter 19.) and it makes τ_3 ? *l*. then $\frac{3}{2}$ *l*. and τ_3 ? *l*. will be found to be $\frac{3}{4}$? *l*. or $\frac{3}{4}$? *l*. by the 7th. Rule of Chapter 19, and in its lowest terms $\frac{1}{2}$? *l*. by the 4th Rule of Chapter 19.

It would have been the fame, if (by the latter part of the 8th Rule of Chapter 19.) you had reduced $\frac{3}{2}$. to the Fraction of a fhilling, which you would have found to have been $\frac{4}{2}s$. which added to $\frac{5}{2}s$, by the faid 17th Rule of the laft Chap. the fum is 15s. $\frac{2}{4}s$, which is equal to the fum found as before, viz. $\frac{3}{4}s$. for (by the sth Rule of Chapter 19.) the value of $\frac{4}{3}s$. will be found to be 15 s. 10 d, and for will 15s. $\frac{2}{4}s$ be found to be just as much.

L

170

k

Subtraction of Chap. 21.

Queft. 9. What is the Sum of $\frac{1}{2}L$ $\frac{1}{2}s$, and $\frac{1}{2}d$: An-forer, $\frac{1}{2}\frac{1}{2}\frac{1}{2}\frac{1}{2}$. or in its loweft terms $\frac{1}{2}\frac{1}{2}\frac{1}{2}\frac{1}{2}$?

CHAP. XXI.

Subtraction of Vulgar Fractions. -

THE Rules in Addition for reducing the given Fractions to one denomination, are here to be observed ; for before Subtradion can be made, the Fractions must be reduced to a common denominator, then fubtract one Numerator from the other, and place the remainder over the common denominator, which Fra-Ation shall be the excess or difference between the given Fractions. Example,

Quest. 1. What is the difference between { and \$? The given frattions are reduced to 11 and 18, then jubtrad the numerator 20 from the numerator 21, and there remains 1, which being put over the denominator 28. makes i for the answer or difference between 1 and 5.

Queft. 2. What is the difference between \$ and \$ of 1?

-Reduce the compound frallion of 3 of 5 to a fimple frallion, then proceed as before, and the answer is He equal to H.

2. When a frattion is given to be fubtratted from a whole number, subtratt the numerator from the denominator, and put the remainder for a numerator to the given denominator; &! (ubtraft an Unit (for that you borrow'd) from the whole number, and the remainder place before the fration found as before, which mixt number is the remainder or difference lought. Example.

Queft. 3. Subtract 7? from 48.

Anfiver, 4773; for if you fubtract 7 (the numerator from 10 (the decominator) there remains 3. which put over 10 is $\frac{1}{10}$ and 1 (I borrowed) from 48 rells 47, to which join 7 and it makes 47 7 for the excels. Quef. 4. Subtract 1 from 47 mains 56 1

Google 3. If

3. If it is required to fubtraft a *fration* from a mixt number, or one mixt number from another, reduce the Frations to a common denominator, and if the fration to be fubtrafted be leffer than the other, then fubtraft the leffer numerator from the greater, and that is a numerator for the common denominator; then fubtraft the leffer integral part from the greater, and the remainder with the remaining *fration* thereto anmexed, is the difference required between the two given mixt numbers. Example,

Queft. 5. Subtract 26 3 from 54 %.

First, Subtract 3, viz. 48 from 5, viz. 25, the remainder is 47, then 26 from 54 remaineth 28, to which annex 43, it makes 2843 for the An/wer.

4. But if the fraction to be subtracted is greater than the fraction from whence you subtract, then having first reduced the fraction to a common denominator, take the numerator of the greater Fraction out of the denominator, and add the remainder to the numerator of the leffer Fraction, and their Sum is a new numerator to the common denominator, which fraction note, then (for the 1 you borrowed) add 1 to the integral part to be subtracted, and subtract it from the greater number, and to the remainder unnex the fradian you noted before, to this new mixt number shall be the difference fought. Example.

Quest. 6. Subtract 142 from 224.

The frations reduced are, viz. equal to $\frac{2}{34}$, and $\frac{4}{34}$ equal to $\frac{1}{34}$, now I thould tubtraft $\frac{3}{34}$ from $\frac{4}{34}$, but I cannot, therefore I tubtraft 21 from 28 refls. 7, which added to 16 (the kfler numerator) makes 23 for a numerator to 28, viz. $\frac{2}{34}$, then I come to the integral parts 14 and 29, and fay, 1 that. I borrowed and 14 is 15, which taken from a9 there refls.14, to which annexing $\frac{2}{34}$ it is $14\frac{1}{3}$ for the remainder or difference between 143 and 294.

Quefl. 7. Subtract 367? from 744, facit 37 22.

CHAP.

12

Chap. 22.

CHAP. XXII.

Multiplication of Vulgar Fractions.

1. If the Multiplicand and Multiplier are fimple (or fingle) Fractions, then multiply the numerators together for a new numerator, and the denominators for a new denominator, which new Fraction is the product required.

Queft. 1. What is the product of 5 by 72? facit 45. For the numerators 5 and 9 being multiplied make 45, and the denominators 7 and 11 being multiplied make 77.

Quelt what is the product of $\frac{1}{13}$ by $\frac{1}{21}$? fac. $\frac{373}{121}$. 2. The fractions to be multiplied are mixt number outce them to improper Fractions by the *i*/*i* the *i* of the chapter, then proceed as before. -

and 1. 3. What is the product of 483 by 135?

Fractions, are 483 equal to 243, and 135 equal to 33, now 243 multiplied by 33 according to the first Rule of this Chapter, produceth 20152 or 6723.

Queft. 4. What is the product of 4307. by 183? fair, 515474 or 793534. 3. If a compound Fraction is to be multiplied by a

3. If a compound Fraction is to be multiplied by a fimple Fraction, first reduce the compound Fraction into a fimple Fraction, then multiply the one by the other, as is taught above.

Queft. 5. What is the product of $\frac{1}{2}$ by $\frac{3}{2}$ of $\frac{4}{2}$ of Compound Fraction $\frac{3}{2}$ of $\frac{5}{2}$ of $\frac{4}{3}$ reduced is $\frac{4}{7}$ or $\frac{1}{7}$, which multiplied by $\frac{4}{12}$ produceth $\frac{1}{7}$, which in its loweft terms is $\frac{1}{2}$ for the Answer.

And if the Multiplicand and Multiplier are both compound Fractions, reduce them both to fimple one, then multiply these new Fractions as before, so have you the product.

Queft. 6. What is the product of $\frac{2}{3}$ of $\frac{3}{2}$ by $\frac{2}{3}$ of $\frac{4}{3}$? Anfwer, $\frac{1}{7}$, in its loweft terms $\frac{4}{3}$. Queft. 7. What is the product of $\frac{3}{4}$ of $\frac{4}{3}$ by $\frac{2}{3}$ of $\frac{4}{3}$? Chap. 23.

Division of, &c.

Anfwer, 18: or 75 or in its leaft terms 1.

4. If a Fraction be to be multiplied by a whole number, put under the given whole number an Unir for a denominator, whereby it will be an improper Fraction, then multiply these Fractions as before. Example.

Quest. 8. What is the product of 24 by ???

Answer, $4\frac{8}{7}$, for 24 by putting an Unit under it will be $2\frac{4}{7}$, and $2\frac{4}{7}$ by $\frac{3}{7}$ produce th $4\frac{8}{7}$ or 16. Queft. 9. What is the product of 36 by $\frac{1}{7}$? Answer,

3-4 or 29 T

CHAP. XXIII.

Division of Vulgar Fractions.

I. IF the Dividend and the Divilor are both fimple

Fractions, then multiply the numerator of the dividend into the denominator of the Divisor, and the product is a new numerator, and multiply the denominator of the Dividend into the Numerator of the Divisor, and the product is a new denominator, which new Fraction thus found, is the Quotient you defire. Example.

Queft. 1. What is the Quotient of & divided by ?? Anfwer, 3 or 11, for first I mul-

tiply (9) the numerator of the divividend into (5) the denominator of

the divisor, and the product (25) is 50 ° 44 a numerator for the Quotient, then 1 multiply (8) the denominator of the dividend into (3) the numerator of the divisor, and the product (24) I put in the quo-tient for a denominator, fo I find $\frac{1}{25}$ is the quotient fought.

Queft 2. What is the quotient of 1? divided by ?? Answer, 2º equal to f in its lowest terms.

2:1

2. But if you would divide a fimple Fraction by a compound, or a compound by a fimple, first reduce

fuch

Vulgar Fractions.

174

Chap. 23.

 $\frac{3}{4} - \frac{8}{1} \left(\frac{4^{\circ}}{2} + \frac{4^{\circ}$

СНАР,

fuch sompound to a fimple Fraction, then go on as before.

Queft. 3. What is the Quotient of $\frac{1}{2}$ divided by $\frac{3}{4}$ of $\frac{3}{2}$? Anjwer, $\frac{1}{2}$, or $\frac{3}{2}$, first reduce $\frac{3}{4}$ of $\frac{3}{2}$ into a fimp'e Fraction, and it is $\frac{1}{2}$, by which $\frac{1}{2}$ being divided, the Quotient is $\frac{1}{2}$, equal in its least terms to $\frac{3}{2}$. And if the Dividend and Divisor be both compound Fractions, reduce them both to fimple Fractions, then divide the one by the other, as in Rule 1. beforegoing.

Queft. 4. What is the quote of $\frac{1}{2}$ of $\frac{1}{4}$ divided by $\frac{3}{4}$ of $\frac{1}{4}$?

Anfwor, $\frac{1}{13}^{\circ}$ or $\frac{1}{13}^{\circ}$ or 1_{7}° or 1_{3}° in its loweft terms. 3. If the Dividend or Divisor, or both are mixt numbers, reduce them to improper Fractions, and perform Division as you were raught before. Example.

Queft. 5. What is the quote of 124 divided by 214? Anjwer, 245, for 124 is equal to 74, and 215 is egual to 108, and the quote of 74 divided by 108 is as before 215.

4. If you divide a Fraction by a whole number, or a whole number by a Fraction, make the whole number an improper Fraction, by putting an Unit for a denominator to it, as was taught in Rule 4. of Chap. 22, and then perform Division as before was taught. Example,

Quest. 6. What is the quote of 8 divided by #?

Anfwer, 4? which is equal to 13;, being reduced as is before directed. See the Work

in the Margent. Quest. 7. What is the "quo-

tient of $\frac{1}{5}$ divided by 8? Anfwer, $-\frac{1}{10}$, $\frac{3}{5}$ $\left(\frac{1}{40}\right)$

Chap. 24.

CHAP. XXIV.

The Rule of Three Direct in Vulgar Fractions.

1. A S in the Rule of Three in whole Numbers, fo likewife in Fractions, you must fee that the Fractions of the first and third places be of the same depomination.

a. See that if any of the given Fractions be compound, that they be reduced to fimple of the fame value.

3 If there are given mixt numbers, reduce them to improper Fractions by the first Rule of Chap. 19:

4. If any of the three terms is a whole number, make it an improper Fraction by conflictuting a Unit for its denominator.

Having reduced your Fraction as is directed in the 4 laft Rules, then proceed to a Refolution which is performed the fame way as in whole Numbers, refpect being had to the Rules delivered for the working of Fractions, viz. multiply the 2d and 3d Fraction together, according to the 1ft Rule of Chap. 22. and divide the product by the first Fraction, according to the 1ft. Rule of Chap. 23. and the Quotient is the Answer. Or (which is better)

5: Multiply the numerator of the first Fraction into the denominators of the fecond and third, and the product is a new denominator, then multiply the denominator of the field Fraction into the numerators of the fecond and third, and the product is a new numerator; which new Fraction is the 4th proportional or answer, which (if it is an improper Fraction) must be reduced to a who'e or mixt number by the third Rule of Chap. 10. Examples.

Quest. 1. If $\frac{3}{7}$ yards of Cloth coft $\frac{5}{5}$. what will $\frac{1}{7}$ vards coft ?

Having placed the given Fractions according to the 6 Rule of Chap. 10. I proceed to the resolution, and first I multiply the numerator of the first Fraction (3)

14

into

Chap. 24.

into 8 and 10, the denominators of the fecond and third fractions and the product is 240 for a denominator, then I multiply 4 the denominator of the first fraction into 5 and 9 the Numerators of the fecond and third fractions.

1,76

yds.	I.	yds.	· <i>I</i> .
3	5	9	180
4	8	.10	240
facit 1	1.	· ·	<u>i</u>
_ jac# 1		cqual	to 3
- 4	40	•	_ 4

the product is 180 for a Numerator, which Numerator 180 and denominator 240 make 12; 1. for the Anfwer, equal to 2 1. or 15 s.

Queft. 2. If $\frac{1}{2}$ l, buy $\frac{2}{5}$ yds of Cloth, what will $\frac{1}{1+5}$ yds coft at that rate?

Answer, $\frac{1}{2}\frac{1}{4}$. equal to $\frac{1}{12}$. or 14 s. 8 d. Queff. 3. If $\frac{1}{4}$. colt $\frac{1}{4}$ s. what will $\frac{1}{3}$ s. buy ? Answer, $\frac{2}{2}\frac{1}{12}\frac{1}{4}$. equal to $\frac{1}{2}\frac{1}{7}$. Queff. 4. If $\frac{3}{4}$ of an Ell of Holland colt $\frac{1}{3}$ of a

greats 4. If $\frac{1}{2}$ of an Ell of Holland coft $\frac{1}{2}$ of a pound, how much will 12 $\frac{3}{2}$ Ells coft at that rate ? Anjmer, $\frac{3}{29}$ equal to $7\frac{1}{27}l$.

In refolving the laft quefion and the two next, obferve the third Rule of this Chapter foregoing.

Queft. 5. If $\frac{1}{7}$? of a C. coft 284 s. what will $7\frac{1}{5}$ C. coft at that rate ?

Anfwer, 23663 s. or 118 t. 6 s. 8 d. -

Queft. 6. If $3\frac{2}{3}$ yds of Velvet coft $3\frac{2}{3}$ l. how much will $10\frac{1}{3}$ yds coft at that rate?

Anfwer, 11+7 6

Quest. 7. If 3 yds of Broad Cloth coft 27 1. what will 14 3 yds coft ?

Anfwer, 13 l. 9 s. 4 d.

In working the last question and the 4 next, observe the 4th Rule of this Chap. foregoing.

Quest. 8. If 14 l. of Pepper coft 14 s. 63 d. I demand the price of 733 l.

Anfover, 3 1. 16 s. 743 d.

Queft. 9. If 1 l. of Cochenele coft 1 l. 5 s. what will 35-2 l. coft ?

Digitized by GOOgle Quest.

Anjwer, 45 l. 17 s. 6 d.

Chap. 25.

Vulgar Fractions.

177

Queft. 10. If one yard of Broad-Cloth coft 15 \$ 35 what will 4 picces, each containing 27 \$ yards at that rate ?

Answer, 851.143. 31d.

Quest. 11. A Mercer bought 31 pcs of filk, each pc. qt. 243 Ells at 6s. 03d. per Ell, I demand the value of 31 pcs at that rate?

- Answer, 261. 25. 43d.

In refolving the 4 next questions observe the 8th Rule of Chapter 19.

Queft. 12. If $\frac{3}{2}$ of an ounce of filver cost 23. I demand the price of $11\frac{3}{2}l$. at that rate ?

Answer, 35 l.

Queft. 13. If 55!. of Gold is worth 2051. 14s. 3⁴/₇d. what is I grain worth at that rate ?

Anfwer, 13.

kueft. 14. If \$ yards of Silk is worth \$ of \$ 1. what is the price of 153 Elis Flemish ?

Anfwer, 91. 125. 6d.

Queft, 15. If $\frac{3}{2}$ of $\frac{3}{4}$ of a pound of Cloves coft 6s $2\frac{1}{2}d$, what coft the C, weight at that rate ?

Anfwer, 69 1. 6s. 8d.

Note that when the Aufwers to the Questions in this and the next Chap. are given in Fractions, they are given in their lowest terms.

CHAP. XXV.

The Rule of Three Inverse in Fractions.

I. IT bath been already taught (in the third Rule of the 11th Chap.) how to different when the 4th proportional number (to the 3 given numbers) is to be found out by a Rule of 3 Direct, and when by a Rule of 3 Inverse, to which Rule the Learner is now referred.

2. When (in Fractions) you find a queftion to be refolved by the Rule of 3 Inverse, viz. when the third Term is the Divisor, (then having reduced the terms,

F

The Rule of Three, &c. Chap. 26.

^cxaft'y according to the Rules in Chap. 24.) multiply the numerators of the 3 Fractions into the denominators of the fecond and first Fractions, and the product is a new denominator, then multiply the denominator of the third Fraction into the numerators of fecond and first Fractions, and the product is a new numerator, which new Fraction thus found is the answer to the question.

Queft. 1. If $\frac{1}{2}$ of a yard of Cloth that is 2 yds wide will make a Garment, how much of any other Drapery that is $\frac{1}{2}$ of a yard wide will make the fame Garment?

Anfwer, 21 yards:

Queft 2. Lent my Friend 461. for $\frac{4}{7}$ of a year, how much ought he to lend me for $\frac{1}{7^2}$ of a year?

Anfroer 63, 11.

178

Quefl. 3. It 3 of a yard of Cloth that is 24 yards wide will make any Garment, what breadth is that Cloth, when 14 yards will make the fame Garment? Anfwer, 48 of a yard wide.

Quelt. 4. How many inches in length of a board that is 9 inches broad will make a foot square?

Answer, 16 inches in length.

Queft. 5. If which the buffled of Wheat coft $4\frac{3}{2}$ s. the peny Loaf weigheth $10\frac{3}{2}$ ounces, what will it weigh when the buffled coft $8\frac{3}{2}s$.

Anfwer, 51 \$4 Ounces.

Quefs. 6. If 12 Men can mow 24¹/₂ Acres in 16²/₅ days, in how many days will 6 men do the fame ? Answer, in 21¹/₂ days.

CHAP. XXVI.

Rules of Practice.

J. IN the fingle Rule of Three, when the first of the 3 Numbers in the Question (after they are difposed according to the 6th Rule of Chap. 10) hapneth Chap. 26. Rules of Practice.

179

to be an Unit (or 1) that Queffion many times may be refolved far more speedily than by the Rule of 3, which kind of Operation is commonly called Practice, and indeed it is of excellent us amongst Merchants, Tradefmen and others, by feason of its speediness in finding a Resolution to such kind of Questions.

2. The chiefest Question resolvable by these brief Rules may be comprehended under the several general heads or cases following, viz.

1. Of farthings under 4.3. Of pence under 12.3. Of pence and farthings.4. Of fhillings under 20.5. Of fhillings, pence and farthings.6. Of pounds.7. Of pounds. fhillings, pence and farthings.

It would be very convenient for the Practical Arithmetician to have by heart the feveral products of the Nine Digits multiplied by 12, for his fpeedy reducing pence into fhillings, or fhillings into pence, which he may gain by the following Table.

-	Cr ¹	1	r 12
	2	-	24
• .	3		36 48
12 Times	4	S is	48
12 11000	6	• «د	72
· ·	7		84
1.81	8		96
· ·	£9J	ŗ,	108 ,

3. Shillings are practically reduced into pounds thus, viz. cut off the figure flanding in the place of: Units with a dath of the Pen and note it for flailings, then draw a line under the given Number, and take

half of the remaining figures (after the first is cut off) and fet them under the line, and

they are to many pounds, but if the -4265 8 last figure is odd, then take the leffer half, and add 10 to the figure fo cut off (as before) for fhillings, as if I were to reduce 43658 shillings into

180

2182.

pounds, first I cut off the last figure (8) for shillings, then I take half of the remaining figures (4365) thus half of 4 is 2, which I put under the line, then half of 3 is 1, and because 3 is an odd number, I make the next figure 6 to be 16, and I go on, faying, half of 16 is 8, and then half of 5 is 2, which is the laft figure, wherefore because 5 is an odd number, I add 10 to the 8] cut off, and it makes 18s. fo that I find it to be 2182 li 18 s. as per Margent.

4. It is likewife convenient that the Learner be acquainted with the practical Tables following, the first containing the Aliquot. (or even) parts of a shilling, the fecond containing the Aliquot parts of a pound.

The even 2 parts of a fhilling.

even

parts of a

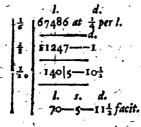

pound.

₫. 10-00 -08 5- 0

4---00

2---04 -06

2-2-00 -08. 00.1 5. When the price of the Integer is a farthing, then take the 6th part of the given number, which will be for many three-half-pences, and if any thing remains it is farthings, by the 7th Rule of Chapter 9. then confider that three-half-pence is $\frac{1}{5}$ of a fhilling, wherefore take the eighth part of them for fhillings, and if any thing remain they are for many 3 half pence, which reduce into pounds by the third Rule foregoing. Example, What comes 67486 *l*. to, at a farthing per *l*. Firlf I take $\frac{1}{2}$ of 67485 and it is 11247 three half-pence and 4 farthings, or one peny; then $\frac{1}{2}$ of 11247 is 1405 *s*. and 7 remains, which is 7 threehalf-pence, or $10\frac{1}{2}d$. which with the 4 farthings before make $11\frac{1}{2}$. d and 1405 fhillings, which by the 3d Rule is 7*cl*. 5*s*. In all 7*cl*. 5*s*. 11 $\frac{1}{2}$. d for the Anfiver. See the Work following.

When the price of the Integer is 2s. then cut e figure in the place of Units of the given number, suble it for fhillings, and the figures on the other are pounds, Example, $436 \ yds$ at r yd. cut off the laft figure 6 and it, it makes 12 fhillings, and the two figures, viz. 43, are for many 43l. 12s. s, fo that there value is 43l. 12s. Margent.

12. Hence

12. Hence it is evident that when the given price of an Integer is an even number of fhillings, then if you take half of that even number of fhillings, and multiply the given number of Intrgers thereby, doubling the first figure of the product, and fetting it apart for fhillings, the reft of the product will be pounds, which pounds and fhillings is the value fought. Example, What coft 536 yds at 8s. per yd? To refolve which I take $\frac{1}{2}$ of 8s. (the price of a yd.) which is 4, and multiply 536 thereby, faying, 4 times 6 is 24, then I double the 536 yds at 8s. first figure 4, makes 8 for fhillings, 4 and carry 2 to the next product, 4

Grc. I find the reft of the product 214 l. 8s. to be 214, which I note for pounds to the value of 536 yds, at 8s. per yd. is 214 l. 8s. as per Margent. More Examples follow.

56 yds at 61. per yd.	420 yds at 125, per yd.

Barter

CHAP. XXVII.

The Rule of Barter.

1. RArter is a Rule amongst Merchants, which (in) the exchanging of one Commodity for another) informs them fo to proportion their Rates as that neither may fuftais lofs.

2. To reloive Questions in Barter, it will not be difficult to him that is acquainted with the Golden Rule, or Rule of 3, it being altogether used in relot-

ving fuch Queflions. Quefl. 1. Two Merchants (viz. A and B) Barter, A hath 13 C. 3 grs. 14 l. of Pepper at 2l. 16s. per C. and B hath Cotton at 9d. per 1, I demand how much Cotton B must give A for his Pepper ?

Anfwer, 9 C. 1 gr.

First, find by the Rule of 3, or the Rules of Practice foregoing, how much the Pepper is worth, faying,

If 1 C. coft 21. 16s. what will 12 C. 2 grs. 14 l. ship

Anfwer, 381. 17 s.

Secondly, By the Rule of 3 fay, If gd, buy 11. of

Cotton, how much will 381. 175. buy ? Anfwer, 94 C. and fo much Cotton must B give to A for 13 C. 3 grs. 14 l. of Pepper at 21. 165. per Cent. when the Cotton is worth gd. per l.

HE GOOGLE ALS.

Chap. 27. Queft. : 2. Two Merchants (A and B) barter, A hath Ginger worth 1 1. 17 s. 4 d. per C. but in barter he will have 2 l. 16 s. per C. B hath Nutmegs worth 5 l. 12 s. per C. now I demand how B muft rate his Nutmegs per C. to make his gain in barter equal to that of A? Anfwer, 8 1. 8 v.

Say, by the Rule of Three, If 1 l. 17 s. 4 d. require 21. 16 s. in barter, what will 51. 12 s. require in barter 2

Facit. 8 l. 8.s.

146

۱

. Onest. 3. A and B barter, A hath 120 yards of Broadcloth worth 6 s. per yd. but in barter he will have 8 s. per yd. B hath Shalloon worth 4 s. per yd. now I demand how many yards of Shalloon B mult give A for his Broad-cloth, making his gain in barter equal to that of A ?

Answer, 180 yds of Shalloon.

First (as in the last question) find out how Bought to fell his Shalloon in barter, wiz. fay, If 6 s. require 8 s. what will 4 s. require ?

Answer, e s. 4 d.

Thus you fee that B must fell his Shalloon in barter at 5 1. 4 d. if A fell his Broad-cloth at 8 s. per yd.

. It remaineth now to find out how much Shalloon B must give for 120 yards of Broad-cloth, which after the fame method used to refolve the first question of this Chapter is found to be 180, and fo many yards of Shalloon must B give A for the 120 yards of Broadcloth.

Quest. 4. A and B bartered, A had 14 C. of Sugar worth 6 d. per 1. for which B gave him & C. 3 grs. of. Cinnamon, I demand how B rated his Cinnamon ser 1.

Answer, 4 s. per l.

Queff. 5. A and B barter, A hath 4 Tun of Brandy worth 27 l. 16 s. ready Money, but in barter he hath so 1. 8 s. per Tun, and A giveth B 21 C. 2 grs. 114 1. of Ginger for his 4 Tun of Brandy, I defire to know how B fold his Ginger in barter per C. and how much it was worth in ready Money.

Google Antwer.

Chap. 28. Queffions in Loss, &c.

Anfmer, For cl. as. and 8d in barter, and it worth 7l. per Cent. in ready Money.

Queft. 6. A and B barter. A hath 320 doxen of C dles at 4s. 6d. per dozen; for which, B giveth I 301. in Money, and the reft in Cotton at 8d. pe I demand how much Cotton he mult give him m than the 301.

Anfwer, 11 C. 1 gr.

Quest. 7. A and B barter. A hath 608 yards of br Cloth worth 14s. per yd, for which B giveth 125l. 12s. ready Money, and 8sl. 2 qrs. 24l Bees Wax, now I define to know how he reckonce Wax per C.

Anfwer, 31. 10s. per C.

CHAP. XXVIII.

Queftions in-Loss and Gain.

gueft. I. A Merchant bought 436 yards of bro cloth for 85: 6d. per yard, and fe it again at 105. 4d. per yard, now I defire to k how much he gained in the Sale of the 436 yards s Anfwer, 201. 195. 4d.

First find out by the Rule of Three, or by prachow much the Cloth cost him at 8s. 6d; per yd. w I find to be 1851. 6s. then by the fame Rule out how much he fold it for, viz. 2251. 5s. then subtract 1851. 6s. which it, cost him, 1 2251. 5s. 4d. which he fold it for, and there rem eth 391. 19s. 4d. for his gain in the Sale thereof Otherwise it may fooner be refolved thus, first out how much he gained per yd. viz. subtract 8s. which he gave per yd., from 10s. 4d. which he fo for per yd. the remainder is 13. 10d. for his gain yd. then fay.

> K.3 Distance to Google

If 1 jd gain 1 s. 10 d. what will 136 jds gain? The Answer by Practice, or the Rule of Three is 39 l. 19 s. 4 d. as was found before.

Quest. 2. A Draper bought 124 yds of Holland Cloth, for which he gave 31 l. I defire to know how he must fell it per yard to gain 10 l. 6 s. 8 d. in the whole Sale of the 124 yds? Answer, at 6 s. 8 d. per yard.

Add the price which it cost him, (viz. 31 %) to his intended gain, (viz. 10 % 6 s. 8 d.) the sum is 41 %. 6 s. 8 d. then fay,

If 124 yds require 41 l. 6 s. 8 d. what will 3 yd require ? By the Rule of Three I find the Anfwer 6 s. 8 d.

Quest. 3. A Grocer bought 3 C. 1 gr. 14 l. of Cloves, which cost him 2 s. 4 d. per l. and fold them for 52 l. 14 s. I defire to know how much he gained in the whole, Answer, 8 l. 12 s.

Queft. 4. A Draper bought 86 Kerfeys for 129 l. I demand how he must fell them per piece to gain 15 4 in laying out 100 l. at the rate? Amprer, 11. 145-6d. fer piece; for,

As 100 % is to 115% to is 129% to 148% 7 ...

So that by the proportion above, I have found how much he must receive for the 86 Kerleys to gain after the rate of 13 *l.* per *C.* then to find how he must fell them per piece. I fay,

At 86 pieces are to 148 l. 7 s. fo is 1 piece to 1 l. 14 s. 6 d, which is the number fought.

Queft. s. A Grocer bought 4[±] C. of Pepper for 15*l*. 17 5. Ad. and (it proving to be damnified) is willing to lofe 12*l*. 10 s. per Cent. I demand how he mult Sel it per *l*. Anfwer, 7 d. per *l*.

Subtract 12 1. 10 s. the loss of 100 L from 100 L.

As reo L is to 87 L to s. fo is 15 L 17 s. 4 d. to 13 L 19 s. 8 d: to much as he must fell it all for to tofe after the rate propounded, then to know how he must fell it per L 1 fay,

As 13 4 17 5, 6 4 14 to 4 C. 6 is 11, to 7 d.

. . Lofe and Gain. Chap, 28. Queft. 6. A Plummer fold to Fodder of Lead (the

Fodder containing 191 C.) for 2041. 15. and gained after the rate of 121. 1cs. per 10cl. I demand how much it cost him jer C? Anjwer,-181. 8d.

To refolve this question add 12%. 10s. (the Gsin per Cens.) to 1001, and it makes 1121. 10s. then fay,

As 112 /. 10s. is to 10cl. for is 2041. 195. to 182/.

Which 1821. is the Sum it coft him in all, then reduce your 10 Fodders to half hundreds, and it makes 390, then fay,

As 200 half hundreds is to 1821. to is 2 half hundreds to 18s. 8d. the price of 2 half hundreds, or one C. weight, and fo much it flood him in per C. weight.

Quest. 7. A Merchant bought 8- Tuns of Wine, which being fophillicated, he felleth for 400% and lofeth after the rate of 12% in receiving 100% now I demand how much it coft him per Tun ? and how he felleth it per Gallon to lofe after the faid rate? Aufmer, it coft sol. per Tun, and he must fell it at 2s. 11d. 210 ers. per Gallon to lofe 1 21. in receiving 1007.

To refoive this question, I confider in the first place, that in receiving rool. he lofeth 121. therefore 10cl. comes in for 1121. laid out, wherefore to find how. much he laid out for the whole, I fay,

As 1001. is to 1121. fo is 4001. to 4481. and fo much the 8 Tuns coft him, then to find how much it coft per Tun, I fay,

As 8 is to 4481, to is I to s61. the price it coff per Tup.

Now to find how he must fell it per. Gallon, reduce the 8 Tuns into Gallons, they make 2016, then fay,

As 2016 Gallons is to 400l. fo is 1 Gall. to 3s. 11d. als grs. the price he must fell it at per Gallon to lole: as aforefaid.

Quest.

Equation of Payments. Chap. 29. Queft. 8. A Merchant bought 8 Tuns of Wine, which being sophisticated, he is willing to fell for 400 1. and bleth at that rate 12 l. in laying out 100 l. upon the fame, now I demand how much it coft him per Tun ?

200

Here I confider that for 100 /. laid out, he receiveth but 88 /. therefore to find what the 8 Tuns coff him, I fay.

As 88 L is to 100 L to is 400 L to 4547 the price it all coft him, then to find how much per Tun, I fay,

As 8 is to 454_{11} h fo is 1 to 56_{11} , or 56 h. 16 s. 4 d. s. fqr. per Tun.

CHAP. XXIX.

Equation of Payments.

C Quation of Payments, is that Rule amonght Merchants whereby we reduce the times for payment of feveral Sums of Money, to an equated time for the payment of the whole Debt without dam. age to Debtor or Creditor, and

The Rule is.

2. Multiply the fums of each particular payment by is respective time, then add the several products to-gether, and their Sum divide by the total Debt, and the quotient thence arifing is the equated time for the payment of the whole debt. Example,

Quest. 1. A is indebted to B in the sum of 1301. whereof so 1. is to be paid at 2 Months, and so 1. 4 months, and the reft at 6 months, now they agree to make one payment of the total Sum, the queftion is what the equated time for payment without damage to Debtor or Creditor?

To

ized by Google

Chap. 29. Equation of Payments.

To refolve this Queflion I multiply each payment by its time, viz.

50 I. multiplied by 2 mon. produceth 50 I. multiplied by 4 mon. produceth 200 30 I. multiplied by 6 mon. produceth 180

The Sum of the product is _____480. @

201

Then I divide 480 (the Sum of the Products) by 1 30 (the total Debt) and the Quotient is 3_T ? months for the time of paying the whole Debt.

Queft 2. A Merchant hath owing him 1000 l. to be paid as followeth, viz. 600 l. at 4 months, 200 l. at 6 months, and the reft (which is 200 l.) at 12 months, and he agreeth with his Debtor to make one payment of the whole, I demand the time of payment without damage to Debtor or Creditor?

600 l. multiplied by 4 mentos is 2400 200 l. multiplied by 6 months is 1200 200 l. multiplied by 12 months is 2400

The Sum of the Product is _____6000

and the Sum of the product (6000) being flivided by the whole Debt (10004) quotes & months for the time of payment of the whole Debt.

3. The truth of this Rule is thus manifeft, if the interest of that Money which is paid (by the equated time) after it is due, The Proof of the be equal to the interest of that Mo-Rule of Equation ney which (by the equated time) is of Payments. paid to much somer than it is due at any rate per C. then the Operation is true, otherwise Bot. Example,

In the laft Queft. 600 L fhould have beenpaid at 4 months, but it is not difcharged till 6 months (that is two months after it is due) wherefore its intereft for 2 months at 5 per Cent. per Annum is 6 L, and then K 5 200 L Equation of Payments: , Chap. 29.

202

2001. was to be paid at 6 months, which is the equated time for its payment, therefore no Intereft is reckoned for it, but 2001. fhould have been paid at 12 Months, but it is to be paid at 6 months, which is 6 months former than it ought, wherefore the intereft of 2001. for 6 months is 61. (accounting 61. per Cent. 10 Months, wherefore the work is right.

Quest. 3. A Merchant hath owing him a certain furm to be diffharged at 3 equal payments, viz. $\frac{1}{2}$ at two Months, $\frac{1}{4}$ at four months, and $\frac{1}{2}$ at 8 months, the question is, what is the equated time for the payment of the whole Debt $\frac{1}{2}$

In quefiions of this nature, (viz. where the Debt is divided into equal or unequal parts) each of the parts is to be multiplied by its time, and the fum of the product is the Answer,

> Addiplied by 2 mon. producetb Multiplied by 4 mon. produceth 1. Multiplied by 8 mon. producetb 2.

The Sum of the Products in 43

which is 43 months for the equated time of payment.

If initial of the Fractions (reprefenting the parts) you had wrought by the numbers themlelves (repreiented by thole parts) according to the first and fecond Examples, it would have been the fame Atfiver, as fuppole the Debt had been 90 l. then 3 of it is 304 for each payment, viz, at 2, 4, and 8 months, then

> 30 1. Multiplied by 2 mon. producetb 60 30 1. Multiplied by 4 mon. produceth 120 30 1. Multiplied by 8 mon. produceth 240

> > The Sum of the Products is 420

which divided by 90 (the whole Pebt) quoteth 45.3 7 months as before. Chap. 29. Equation of Payments.

Queft. 4. A Merchant oweth a Sum of Money to be paid $\frac{4}{3}$ at 5 months, and $\frac{1}{4}$ at 8 months, and $\frac{4}{3}$ at 10 months, and he agreeth with his Creditor to make one total payment; I demand the time, without damage to Debtor or Creditor? Work as in the laft Queftion, and you will find the Answer to be 7 months.

Queft. 5. A is indebted to B 640 *l*. whereof he is to pay 40*l*. prefeut money, and 350*l* at 3 months, and the reft (viz. 250*l*.) at 8 months, and they agree to make an Equated time for the whole payment?" now I demand the time?

In queffions of this nature (viz. where there is ready money paid) you are in Multiplying, to negleft the money that is to be paid prefent, and work with the reft as is before directed, and divide the fum of the products by the whole Debt, and the Quote is the Anfwer : For here 4cL is to be paid prefent, and hath no time allowed, and according to the Rule it fhould be multiplied by its time, which is (0) therefore 40 times 0 is 0, which neither augmenteth mor diminible the Dividend; wherefore (to proceed a according to direction) I fay,

> 350 by .3 Months produceth _____ 1050 . 250 by 8 Months produceth _____ 2000 .

> > The Sum of the product is _____ 3050

which divided by 640, the whole Debt, the quote is -42? Months, the time of payment.

Quest. 6. As is indebted to B in a certain Sum; whereof is to be paid present Money, 4 at 6 months, and the reft at 8 Months; now I demand the equated time for the payment of it all?

Anywer 21 months is the time of payment.

Quell. 7. A is indebted to B 120%. whereof $\frac{1}{2}$ is to be paid at 3 months, $\frac{1}{2}$ at 6 months, and the reft at 9 months; what is the equated time for the payment of the whole Sum 1 $\frac{1}{2}$

203

Answer, 64 months.

204

Queft. 8. A is indebted to B 4201. which is due at the end of 6 months, but A is willing to pay him 1401. prefent, provided he can have the remainder forborn fo much the longer to make fatisfaction for his kindnefs, which is agreed upon, I defire to know what time ought to be allotted for the payment of the 2801. remaining?

To refolve this queftion, firft, find out what is the interest of 1401. for the time it was paid beforeit was due, at 6 per Cent. (or any other rate) viz. 6 months) and you will find it to be 41. 45. Then it is evident that the remaining 2801. multiple detained fo much longer than 6 months as the while it may eat out that interest, viz. 41. 45. which is thus found out, viz. First, see what is the Interest of 2801. for a month, or any other time; but here we will take one month, and its Interest, for one month is 285.

Then by the Rule of Three, fay,

As 28s. is to 1 month, fo is 84s. to 3 months; fo that the 28ol: remaining must be kept 3 months, beyond its first time of pay ment (wiz. 6 months) which added thereto, makes 9 months, at the end of which time A ought to make payment of the remainder.

CHAP. XXX.

EXCHANGE.

I. THE Rule of Exchange informeth Merchants how to exchange Moneys, Weights, or Measures of one Country into (or for) the Moneys, Weights, or Measures of another Country, and when the Rate, Reason, or Proportion betwixt the Money, Weights, or Measures of different Countrys is known, it will not be difficult for the Practitioner that is well acquainted with the Rule of proportion (or Rule of Three) to resolve any Question wherein it is required

to

205

Chap: 30.

to Exchange a given quantity of the one kind into the fame value of another kind.

2. In Queftions of Exchange there is always a comparison made between the Coyns, drc. of two Countries (or kinds) or of more.

3. In Questions where there is a comparison made between two things (whether they be Moneys, Weights, (rc.) of different kinds or (Countries) there may be a folution found by a fingle Rule of Three, as may appear by the following Example.

Quest. 1. A Merchant at London deliver'd 370 1. Sterling, to receive the fame at Paris in French Crowns ; the Exchange 33 French Crowns per pound Sterling. I demand how many French Crowns ought he to receive?

In placing the numbers observe the 6th Rule of the 10th Chapter, which being done, the given numbers will stand thus,

· 1.

Crowns -3-3---and being reduced according to the Rules of the 24th Chapter, will stand thus ;

1. Crowns Crowns As # is to 1; fo is 37? to 12331.

So that I conclude he ought to receive 1233; French Crowns at Paris for 370 L. delivered at London.

Queft. 2. A Merchant delivered at Amsterdam \$87 1. Flemi(b to receive the value thereof at Naples in Ducats; the Exchange 44 Ducats per 1. Flemifle. I demand how many Ducats he ought to receive ?

The proportion is as followeth.

1. Ducats 1. Ducats -As + is to 24 fo is " 17 to 2817 #"

So I find he ought to receive 28174 Ducats at Naples, for the 587 1. Flemifb delivered at Amsterdam.

Quest.4. A Merchant at Florence delivereth 2478 Dincatgons, to receive the value at London in pence, the Exchange 531 pence Sterling per Ducatoon. I demand how much Sterling he ought to receive?

The Proportion for Refolution is,

Chap. 30

Duc. d. Due. d. As $\frac{1}{2}$ is to ' °? fo is ⁵⁺⁷ to 186073

which is equal to 7751. 6-1 for the Answer.

I might here (according to the Cultom of Arithmetical Writers) lay down Tables for the Reduction of Foreign Coyns to English; but by Reason of their Inflability (for they continue not at a conflant standard, as our Sterling Money doth, but are fometimes raised, and fometimes depressed) I shall forbear.

4. When there is a comparison made between more than two different Coyns, Weights or Measures, there ariseth ordinarily two different cases from such a comparison.

r. When it is required to know how many pieces of the first Coyn, Weight or Measure, are equal in when to a known number of pieces of the last Coyn, Weight or Measure.

2. When it is required to find out how many pieces of the laft Coyn, Weight or Measure; are equal in value to a given Number of the first fort of Coyn, Weight or Measure.

An Example of the fuft Cafe may be this, VI Z.

Queff: 4. If 1 50 pence at London are. equal to 3 Dueats at Naples, and 47 Ducats at Naples make 34[±] thilings at Bruffels, then how many pence at London are. equal to 138 shiftings at Bruffels? Facit, 960 d.

This quefition may be refolged at two fingle Rules of Three; for first, I fay,

If 1 Ducars at Naples make 150 pence at London, how many pence will 42 Ducars make?

Answer, 240 penee.

By the foregoing Proportion, we have difference ed that 44 Ducats at Naples make 240 pence at Landon; Chap. 30. London : And by the Tenour of the Question we fee. that 44 Ducats at Venice make 34.ª thillings at Bruffels,

therefore 240d. at London are equal to 34 s. at Bruffels, (for the things that are equal to one and the fame thing are allo equal to one another) wherefore we have a way laid open to give a folution to this Queftion by

another fingle Rule of Three, whole proportion is, As 34¹/₂ thillings at Bruffels is to 240 pence at Lon-don, fo is 138 thillings at Bruffels to 960 pence at Landon, which is the Aniwer to the Queition.

An Example of the second Case may be thus, VIZ.

Queft. 5. If 4cl. Averdupois weight at London is cqual to 361. weight at Amsterdam, and gol. at Amsterdam makes 1 161. at Dantzick, then how many pounds at Dantzick are equal to 1121. of Averdupeis weight at London.

Answer, 12913 pounds at Dantzick.

This Question is likewife answered at two single Rules of Three, wiz. First, I fay,

As 364, at Amflerdam is to 404 At London, >

So is gol. at Amsterdam to 1 gol. at London.

And by the queftion you find that gol. at Amflerdam is 1161. at Dantzick, and therefore 1001, at London is. likewife equal thereus to, wherefore again, Lfay,

As 10cl. at London is to 1161: at Dantzick,

So is 1121, at London to 1291 1. at Dantaick.

By which I find that 129 1 at Dantzick are equal to. 1121. Averdupois weight at London.

5. There is a more fperdy way to refolke fuch Quefions as are contained under the two Cafes beforementioned, laid down by Mr. Kerfey in the third Chapter of his Appendix to Mr. Wingate's Arithmetick, where he hath given two Rules for the Refolution of the Queflions pertinent to the two faid Cafes.

6. But I shall lay down a general 'Role for the folution of both Coles; and first, let the Learner observe the following Directions in placing of the given teams, Google ųz,

7: Let there be made two Columns, and in their Columns to place the given terms one over the other, as that in the fame Column there may not be found two terms of the fame kind one with the other.

Having thus placed the terms, the general Rule is, Observe which of the faid Columns hath the most terms placed in it, and multiply all the Terms therein continually, and place the last product for a divi-dend; then multiply the terms in the other Column continually, and let the last product be a Divisor, then divide the faid Dividend by the faid Divisor, and the Quotient then arising is the Answer to the Queftion.

So the Example of the first of the faid Cafes being again repeated, vize if 150 pence at London make 3 Ducats at Naples, and 44 Ducats at Naples make 34 fhillings at Bruffels, then how many pence at London are equal to 138 fhillings at Bruffels?

The terms being placed according to the 7th Rule will fund as followeth.

	A	В	. .
Pence at Lond. Ducats at Na. Shill: at Bruff-	1-50 4 1 1 28		Ducats at Na. Shill. at Bruff.
			a sisher Column

having thus placed the Terms that in either Column there is two terms of one kind, then observe that the Column under A hath most terms in it, therefore they must be multiplied together for a dividend ; wiz. 150 multiplied by 44 produceth 360\$, which multiplied by 138 produceth 49680\$ for a dividend, then in the Column under B there are 3 and $34\frac{1}{3}$, which multipli-ed together produce $23\frac{1}{3}$ for a divisor; then having divided 495.00 by 107; the quotient is 960 pence for the answer as before.

Again, let the Example of the feoond Cale be again repeated, viz II 40 l. Averdupois weight at London make 361. weight at Amfterdam, and 901. at Amfterdam make 116 l. at Dantziek, then how many pounds at Dantzick are equal to 1124 Averdapois weight at Las. daz. dbyGoogle

The

Chap: 31. Single Position. 209 The terms being disposed according to the 7th Rule foregoing will stand thus, A B I. at Lond. 40 36 I. at Amslerdam I. at Amst. 90 1.16 I. at Dantzick 1.12 I. at London.

whereby I find that the Terms under B multiplied together produce 467712 for a dividend, and the Terms under A, viz. 40 and 90 produce 3500 for a divisor, and Division being finished, the quotient giveth 1293213 pounds at Dantzick for the Answer.

CHAP. XXXI.

Single Position.

1. N Egative Arithmetick, called the Rule of Falle, is that by which we find out a touth, by numbers invented or supposed, and this is either fingle or double.

2. The Rule of Single Polition is when at once, vizby one falle polition, or feigned number, we find out the true number fought.

3. In the fingle Rule of Falfe, when you have made choice of your polition, work it according to the tenour of the queftion, as if it were the true number fought, and if by the ordering your polition you find the refult either too much or too little, you may then find out the number fought by this proportion following, viz.

As the refult of your position is to the polition, fo is the given number to the number lought.

Example.

Queft. I., A perfon having about him a certain number of Crowns, faid, if the fourth and third and fixth of them were added together, they would make juft 45 5 now I demand the number of Crowns he had about him ? Anfwer, 60 Crowns. To refolve this queflion, I suppose he had 24 Crowns (cr any other number that will admit of the like division) now the fourth of 24 is 6, and the third is 8, and the fixth is 4, all which parts, (viz. 6, 8, and 4) being added together make but 18, but it fhould be 45, wherefore I fay by the Rule of Three,

As 18, the Sum of the parts is to the polition 24, to is 45 the given number to 60, the true number fought.

For the fourth of 60 is 15, and the third of 60 is 20, and the fixth of 60 is 10, which added together make 45.

Queft. 2. Three Perfors, viz. A, B, C, thus difcourfe together concerning their Age, quoth B to A, I am as old and half as old again as you, then quoth C to B, I am twice as old as you, then quoth A to them, and I am fure the Sum of all our Ages is 165, now I demand each Man's Age? Anfwer, A 30, B 45, C 50 years of Age, which added together, make 165.

CHAP. XXXII.

Deuble Position.

1. THE Rule of Double Position is when 2 falls Positions are assumed to give a Resolution to the question propounded.

2. When any Queflion is flated in double Position make such a Crois as followeth.

3. Then make choice of any number you think may be convenient for your working, which call your first position, and place it at that end of the Crois at 4, then work with this position (as if it were the true Goode number

210

number fought) according to the nature of your queftion, then having found out your erron, either too much or too little, place it on that fide the Crofs at d, then make choice of another number of the fame denominations with the first Position (which call your fecond Position) and place it on that fide of the Crofs at b; then work with this Position as with the former, and having found out your error, either too much or too little, place it on that fide of the Crofs at c, and then the Positions will find at the top of the Grofs, and the errors at the bottom, each under his correspondent Position, and then multiply the errors into the positions crofs-wife, that is to fay, multiply the first position by the fecond error, and the fecond position by the first error, and put each product over its position.

4. Having proceeded to far, then confider whether the errors were both alike, that is, whether they were both too much, or both too little, and if they are alike, then subtract the lefter product from the greater, and set the remainder for a dividend, then subtract the lefter error from the greater, and let the remainder be a divisor, then the quotient arising by this Division, is the answer to the question.

5. But if the errors are unlike, that is one too much and the other too little, then add the products of the pofitions, and errors together, and their fum fhall be a dividend, then add the errors together, and their fum fhall be a divifor, and the quotient arifing hence is the Anfwer; which two laft Rules may be kept in memory by this Verfe following, viz.

When Errors are of unlike kinds Addition doth enfue, But if alike Subtraction finds Dividing work for you.

Queft. r. A, B and C build a House which coft 76 l. of which A paid a certain Sum unknown, B

paid

Goodle

Double Position.

212

B paid as much as A, and 10%. over, and C paid as much as A and B, now I defire to know each Man³ fhare in that charge ?

Having made a crofs according to the fecond Rule, I come according to the third Rule to make choice of my first position; and here I suppose A paid 61. which I put upon the crofs as you (ce, then B paid 161. (for it is faid he had paid 101. more than A) and C paid 221. for 'tis faid he paid 25 much as A and B, then I add their parts.

L _.		L.

76	12	76
76 56		
20	· · · ·	Error 32

and they amount to 44, but it is faid they paid 961. wherefore it is 32 too little, which I note down at the bottom of the crofs under its position for the first Error.

Secondly, I fuppole A paid cl. then B paid 10l.and C 28l. all which added together make 56, but they fhould make 76, wherefore the Error of this polition is 20, which I put at the bottom of the crois under his polition for the fecond Error, then I multiply the Errors and the politions crois-wile, vir, 32(the Error of the first polition) by 2 (the fecond pofition) and the product is 288. Then I multiply 20 (the Error of the fecond polition) by δ (the first polition) and the product is 120.

Then (according to the 4th Rule) I fubtrat the leffer product from the greater (viz. 120 from 288, becaule the Errors are both alike, viz. too little)

igitized by GOOGIC

and

Chap. 32.

and there remaineth 168 for a Dividend, then I subtract 20 (the leffer Error) from 32 (the greater Error) and the remainder is 12 for a divisor, then divide 168 by 12, and the Quotient is 14 for the Answer, which is the share of A in the Payment.

6. Again Secondly, If the Errors had been both too big it had had the fame effect, as appeareth by the following Work; for first I suppose A paid 201 then B paid 301 and C 501 which in all is 100, but it should have been no more than 76, wherefore the first Error is 24 too much. Again, I suppose A paid is1. then B must pay 281 and C must pay 461 which in all

20 A 30 B	, · · · · · · · · · · · · · · · · · · ·	A 18 B 28
50 °C	320 112 432	C 46
100 Sum 76 Subtr.	8) 24 16 14 facit	Súm 92 Subtr. 76
24 Error	8	Error 16

is 921. but it fhould have been but 761. wherefore the fecond Error is 16 too much: then I multiply 20 (the first Polition) by 16 (the fecond Error) and the product is 320; again I multiply 18 (the fecond Polition) by 24 (the first Error) and the product is 432, Then becaule the Errors are both too much, I fubtract 320 the leffer product (from 432 (the greater product) and there remains 112 for a dividend, likewife I fubtract 16 (the lefter Error) from 24 (the greater Error) and the difference is 8 for a dividor, then perform Division, and the quotient is 14 (as before) for the answer.

Again Thirdly, If the Errors had been the one too big and the other too little, Respect being had to the 5th Rule foregoing, the Answer would have been the same; as thus, I take for my first Position 6, and then the Error is 32 too little, then I

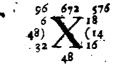

take

Double Position.

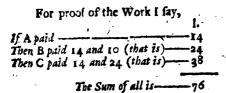

214

take for my fecond polition 18, and then the error is 16 too which, then I multiply the politions and errors cross-wife, and the products are 96 and 576, and becaule the Krrors are unlike,

Chap. 32.

(viz) one too big, and another too little, I add the products of and 595 together, and their Sum is 692 for a dividend; I likewife add the errors 32 and 16 together, and their fum is 48 for a Divifor, then having finished Division, I find the Quotient to be 14, which is the aniwer as was found our at the two feveral Tryals before.

which is the total value of the building, and equal to the given number.

Thole who defire to fee the demonstration of this Rule, let them read the 7th Chap. of Mr. Kerfer's Appendix to Wingate's Arithmetick, Petifcus in the 5th Book of Trigonometria. Or Mr. Oughtred in his Clavie Mathematics.

Queff. 2. Three Perfons, A, B, C, thus difcourfed together concerning their Age; quoth A I am 18 years of Age, quoth B I am as old as A and $\frac{1}{2}$ C; and quoth C, I am as old as you both, if your years were added together. Now I defire to know the Age of each perfon? Anfwer, A is 18, B is 54, and C is 72 years of ic. Double Position.

215 /

Shap. '32.

Queft. 3. A Pather lying at the point of Death, left. o his 3 Sons, viz. A, B, C, all his Effate in Mohey, ind divideth it as followeld, viz. to A he gave $\frac{1}{2}$ wantng 441. to B he gave $\frac{1}{4}$ and 141. over, and to C is gave the remainder, which was 82l, lefs than the hare of B, now I demand what was the Sum left, and each Man's part? Answer, The Sum bequeathed was 5881 and whereof A had 2501 B had 2101. and C had 1281.

Queft. 4. Two perfons, viz. A and B had each in their hands a certain number of Growns, and A faid to B, if you give me one of your Growns I shall have five. times as many as you; and faid B to him again, if you give me one of yours, then we shall each of us have an equal number; now I demand how many Growns had each perfor? Anfwer; A had 4, and B had 2 Growns.

Queft. 5. What number is that unto which if I add $\frac{1}{2}$ of it felf, and from the Sum fubtract $\frac{1}{4}$ of it felf, the remainder will be 216 ? Answer, 192.

Many more questions may be added, but these well understood, will be sufficient, (even for the meanest Capacity) for the Resolution of any other question pertinent to this Rule.

There may be an objection made because we have not treated particularly upon Interest and Rebate, but the operation of such Questions being more applicable to Decimals, are omitted, till we come to acquaint the Learner therewith.

Lans Deo Soli.

FINIS.

7

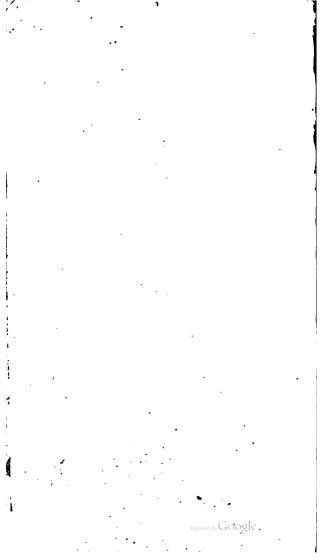

Marbam's Matter-piece Revived, containing a knowledge belonging to the Smith, Farrier, Horfe-Leach, touching the Curing all Difeates : Horfes; and now in this Imprefilion is added the Copleat Jockey, containing the method for the Trainit: up of Horfes for Racing, with their Heats and Couriand manner of keeping; allo inftructions for Buyer to avoid Cheating Horfe-Courfers, and all things is cellary for Gentlemen and others.

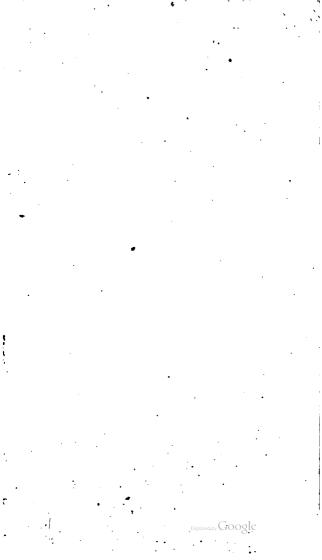

Dr. Newton's Cosmographia, or a view of the Globe being an Explanation of the Principles of Geometry applied to Surveying and Gauging of Casks, to while is added an Instruction to Geography.

ADVERTISËMENT.

Here is lately brought from Chily, a Province in America, a most excellent natural Balfam, found by feveral eminent Perfons to excel that of Pern and Tolu, in curing of divers Difeafes hath given Demonfitt 'Tis a remedy that no Man under the Sun ca tion. Compose, being a most Odoriferus and Natural Ballan. It cures most Difeases in Human Bodies; particularly helps all Pains coming from Cold, chiefly pains in the Stomach, want of Appetite : Corroborating & firengthning the whole Body. 'Tis a wonderful Remedy for all inward Sores, Bruifes, or Ulcers of the Lungs, Reins, Bladder, or Womb, Oc. It helps Shortnefs of Breath, Cough, or Confumption, or Wheefings : 'Tis good in moft Difeates of the Head : as Falling-Sickness, Apoplexy, Palfie, Trembling Convultions, Head-ach, and Giddiness of the Head; and strengthens the Brain and Nerves. It kills Worms and helps the Stone, and is a good provoker of Urine, and brings away the Sand and Gravel, which oftentimes obstructs the Urine. It helps all Flaxes of the Belly; and 'tis a wonderful thing for moff Difeates of the Ears, especially Deafuels: And outwardly applied, Cures all manner of Green-Wounds, Ulcerstand Fiftula's. And Cures moft Difeates in Women. It is only to be had of Eben. Tracey, at the Three Bibles on London Bridge, at 1s. 6d. the Ounce. The "tles are Sealed with the Balfam-Tree.
